**Table 64:** Parameters in the output from the **show ip dhcp snooping statistics** command

Parameter	Description
Interface	The interface name.
In Packets	The total number of incoming packets that are processed by DHCP Snooping.
In BOOTP Requests	The total number of incoming BOOTP Requests.
In BOOTP Replies	The total number of incoming BOOTP Replies.
In Discards	The total number of incoming packets that have been discarded.
Invalid BOOTP Information	Packet contained invalid BOOTP information, such as an invalid BOOTP.OPCode.
Invalid DHCP ACK	A DHCP ACK message was discarded, for reasons such as missing Server Option or Lease Option.

**Table 64:** Parameters in the output from the **show ip dhcp snooping statistics** command (cont.)

Parameter	Description
Invalid DHCP Release or Decline	A DHCP Release or Decline message was discarded, for reasons such as mismatch between received interface and current binding information.
Invalid IP/UDP Header	A problem was detected in the IP or UDP header of the packet.
Max Bindings Exceeded	Accepting the packet would cause the maximum number of bindings on a port to be exceeded.
Option 82 Insert Error	An error occurred while trying to insert DHCP Relay Agent Option 82 information.
Option 82 Received Invalid	The DHCP Relay Agent Option 82 information received did not match the information inserted by DHCP Snooping.
Option 82 Received On Untrusted Port	A packet containing DHCP Relay Agent Option 82 information was received on an untrusted port.
Option 82 Transmit On Untrusted Port	A packet containing DHCP Relay Agent Option 82 information was to be sent on an untrusted port.
Reply Received On Untrusted Port	A BOOTP reply was received on an untrusted port.
Source MAC/CHADDR Mismatch	The L2 Source MAC address of the packet did not match the client hardware address field (BOOTP.CHADDR).
Static Entry Already Exists	An entry could not be added as a static entry already exists.

# show ip source binding

**Overview** Use this command to display static entries in the DHCP snooping database. These are the entries that have been added by using the [ip source binding](#) command.

**Syntax** `show ip source binding`

**Mode** User Exec and Privileged Exec

**Example** To display static entries in the DHCP snooping database information, use the command:

```
awplus# show ip source binding
```

**Table 65:** Example output from the **show ip source binding** command

```
awplus# show ip source binding

IP Source Bindings:

Client MAC
IP Address Address VLAN Port Expires

1.1.1.1 0000.1111.2222 1 port1.0.1 Infinite Static
```

**Table 66:** Parameters in the output from the **show ip source binding** command

Parameter	Description
Client IP Address	The IP address of the DHCP client.
MAC Address	The MAC address of the DHCP client.
VLAN	The VLAN ID the packet is received on.
Port	The Layer 2 port name the packet is received on.
Expires (sec)	Always infinite for static bindings, or when the leave time in the DHCP message was 0xffffffff (infinite).
Type	DHCP Snooping binding type: Static

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure the OpenFlow protocol.

- Command List**
- “openflow” on page 2842
  - “openflow controller” on page 2843
  - “openflow datapath-id” on page 2845
  - “openflow failmode” on page 2846
  - “openflow inactivity” on page 2848
  - “openflow native vlan” on page 2849
  - “openflow ssl peer certificate” on page 2850
  - “openflow ssl trustpoint” on page 2851
  - “openflow version” on page 2852
  - “show openflow config” on page 2853
  - “show openflow coverage” on page 2855
  - “show openflow flows” on page 2857
  - “show openflow rules” on page 2860
  - “show openflow ssl” on page 2862
  - “show openflow status” on page 2863

# openflow

**Overview** Use this command to specify a port or static aggregator as a data plane port. The ingress and egress traffic on the data plane port become controlled by the OpenFlow Controller. A data plane port number is assigned to the port automatically.

Use the **no** variant of this command to cancel the setting of a port as a data plane port.

**Syntax** openflow  
no openflow

**Default** All the ports are non-data plane ports by default.

**Mode** Interface mode for a switch port (e.g. port1.0.1) or static aggregator (e.g. sa1)

**Example** To specify port1.0.1 as a data plane port:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# openflow
```

**Related commands** [show openflow config](#)

**Command changes**

- Version 5.4.6-1.1: command added
- Version 5.4.7-1.1: command added to GS900MX, XS900MX, x550 series products
- Version 5.4.7-2.1: command added to IE300, IE500 series products
- Version 5.4.8-0.2: added to SBx908 GEN2
- Version 5.4.8-1.1: added to IE210L series products

# openflow controller

**Overview** Use this command to specify the controller name, address, and port number of the OpenFlow Controller. If you do not specify a controller name, a name will automatically be created using the following format: 'ocxx', where 'xx' is the sequential number starting from 1.

You can specify one or more OpenFlow Controllers to the switch.

Use the **no** variant of this command to delete one or more OpenFlow Controllers specified to the switch.

You can delete a controller by specifying only the controller name. If you do not know the controller name, you can identify it from the **show openflow config** command output.

**Syntax**

```
openflow controller <protocol> <address> <port>
openflow controller <controller-name> <protocol> <address>
<port>
no openflow controller <controller-name>
```

Parameter	Description
<controller-name>	The user specified or auto-generated (in the case of legacy syntax) controller name that can contain alphanumeric and/or special characters other than the following set of characters: ':', '=', ',', '[', ']', '{', '}', ' ', '<', '>'
<protocol>	The protocol type to communicate with the OpenFlow Controller.  There are two options: TCP and SSL. Use TCP for an insecure connection. Use SSL for a connection protected by TLS. OpenFlow switches support TLSv1.0, TLSv1.1 and TLSv1.2. The TLS version used between an OpenFlow switch and OpenFlow Controller is determined by peer negotiation.
<address>	The IPv4 address of the Controller.
<port>	Port number used to communicate with the Controller. The IANA has assigned the number 6653 for this purpose, but a different number can be used for local reasons.

**Default** No OpenFlow Controller is configured by default.

**Mode** Global Configuration

**Usage notes** The older version of this command is supported. If you enter the legacy CLI syntax (without the controller name), it will automatically adapt and display in the running configuration as the newer syntax.

For example, entering the legacy command:

```
awplus(config)# openflow controller tcp 192.168.1.2 6653
```

Displays as following in the running-config:

```
awplus(config)# openflow controller ocl tcp 192.168.1.2 6653
```

**Examples** To add an OpenFlow Controller with the address 10.1.1.1 using the TCP protocol and the IANA assigned port number of 6653, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# openflow controller tcp 10.1.1.1 6653
```

To add an OpenFlow Controller for the switch whose name is controller1, with the address 10.1.2.1 using the TCP protocol on port number 6653, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# openflow controller controller1 tcp 10.1.2.1
6653
```

To delete an OpenFlow Controller whose name is controller1, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no openflow controller controller1
```

**Related commands** [show openflow config](#)

**Command changes**

- Version 5.4.7-1.1: command added
- Version 5.4.7-2.1: command added to IE300, IE500 series products
- Version 5.4.8-0.2: added to SBx908 GEN2
- Version 5.4.8-1.1: added to IE210L series products
- Version 5.4.8-2.1: <controller-name> parameter added

# openflow datapath-id

**Overview** Use this command to change the Datapath Identifier (DPID) of the OpenFlow switch.

Use the **no** variant of this command to revert back to the default DPID.

**Syntax** `openflow datapath-id <dpid>`  
`no openflow datapath-id`

Parameter	Description
<code>&lt;dpid&gt;</code>	The DPID field consists of 16 Hex digits. If you specify a DPID less than 16 Hex digits, then the upper bits are padded out with zeros.

**Default** Each OpenFlow instance on a switch is identified by a Datapath Identifier. This is a 64 bit number. By default, the lower 48 bits are configured based on the switch MAC address. The top 16 bits are padded with zeros.

**Mode** Global Configuration

**Usage notes** This command changes the DPID, which is used as the OpenFlow switch ID in OpenFlow Controller(s).

**Example** To change the DPID to "0000000000000001", use the commands:

```
awplus# configure terminal
awplus(config)# openflow datapath-id 1
```

To revert back to the default DPID, use the commands:

```
awplus# configure terminal
awplus(config)# no openflow datapath-id
```

**Related commands** [show openflow status](#)

**Command changes**  
Version 5.4.7-1.1: command added  
Version 5.4.7-2.1: command added to IE300, IE500 series products  
Version 5.4.8-0.2: added to SBx908 GEN2  
Version 5.4.8-1.1: added to IE210L series products

# openflow failmode

**Overview** Use this command to set the operation mode for the switch when the Controller connection fails or no Controllers are defined.

Use the **no** variant of this command to return to the default mode.

**Syntax**

```
openflow failmode secure non-rule-expired
openflow failmode standalone
no openflow failmode
```

Parameter	Description
secure non-rule-expired	Set the mode to secure non-rule-expired. See the Usage section for details.
standalone	Set the mode to standalone. See the Usage section for details.

**Default** Secure mode, without the **non-rule-expired** option

**Mode** Global Configuration

**Usage notes** If an OpenFlow switch loses contact with all Controllers as a result of echo request timeouts, then the OpenFlow switch goes into **fail mode**. There are three fail modes available:

- In **standalone** mode, if no message is received from the OpenFlow Controller for three times the inactivity probe interval, then OpenFlow will take over responsibility for setting up flows. OpenFlow will cause the switch to act like an ordinary MAC-learning switch, but continue to retry connecting to the Controller in the background. When the connection succeeds, it will discontinue its standalone behavior.

**NOTE:** If the OpenFlow switch is in fail mode, and you change the configured fail mode to or from standalone mode, OpenFlow will flush all existing rules.

- In **secure** mode, OpenFlow will not set up new flows on its own when the Controller connection fails or when no Controllers are defined, but all existing flows are left in place. The switch will continue to retry connecting to any defined Controllers forever, unless a rule timeout causes it to expire.

This mode is the default, and you can also set it by using the command **no openflow failmode**.

- In **secure non-rule-expired** mode, OpenFlow will not set up new flows on its own when the Controller connection fails or when no Controllers are defined, but all existing flows are left in place. The switch will continue to retry connecting to any defined Controllers forever. The **non-rule-expired** parameter means that existing rules won't be expired regardless of their timeouts while under fail mode. In other words, the OpenFlow switch will ignore timeout values of both *idle timeout* and *hard timeout* in existing rules.

**Example** To set the fail mode to **standalone** mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow failmode standalone
```

To set the fail mode to **secure non-rule-expired** mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow failmode secure non-rule-expired mode
```

To revert the fail mode to the default mode, use the commands:

```
awplus# configure terminal
awplus(config)# no openflow failmode
```

**Related commands** [openflow controller](#)

**Command changes**

- Version 5.4.7-1.1: command added
- Version 5.4.7-2.1: command added to IE300, IE500 series products
- Version 5.4.8-0.1: non-rule-expired parameter added
- Version 5.4.8-0.2: added to SBx908 GEN2
- Version 5.4.8-1.1: added to IE210L series products

# openflow inactivity

**Overview** Use this command to set the value of the Controller inactivity timeout.  
Use the **no** variant of this command to reset the inactivity timeout value to its default.

**Syntax** `openflow inactivity <5-2073600>`  
`no openflow inactivity`

Parameter	Description
<code>&lt;5-2073600&gt;</code>	Specifies the timeout value in seconds
<code>inactivity</code>	OpenFlow inactivity probe

**Default** 10 seconds.

**Mode** Global Configuration

**Usage notes** OpenFlow uses the inactivity probe timer to monitor its connection to Controller(s). If no message is received from any Controller for three times the inactivity probe interval, then OpenFlow will take over responsibility for setting up flows, if in standalone mode.

**Example** To configure the inactivity probe timeout to 20 seconds, enter the commands:

```
awplus# configure terminal
awplus(config)# openflow inactivity 20
```

To reset the inactivity probe timeout to its default value of 10 seconds, enter the commands:

```
awplus# configure terminal
awplus(config)# no openflow inactivity
```

**Related commands** [openflow controller](#)

**Command changes**  
Version 5.4.7-1.1: command added  
Version 5.4.7-2.1: command added to IE300, IE500 series products  
Version 5.4.8-0.2: added to SBx908 GEN2  
Version 5.4.8-1.1: added to IE210L series products

# openflow native vlan

**Overview** Use this command to specify a VLAN as a native VLAN for the data plane ports. You must create a VLAN (using the [vlan database](#) command) before specifying the VLAN as a native VLAN.

The OpenFlow native VLAN **must** be different from the native VLAN of the control plane. This prevents the OpenFlow ports from receiving any broadcast or multicast traffic flooded on the control plane native VLAN.

The VLAN used as the OpenFlow native VLAN should not be used on non-OpenFlow ports.

Use the **no** variant of this command to change the native VLAN for the data plane ports back to the default VLAN 1.

**Syntax** `openflow native vlan <vlan-id>`  
`no openflow native vlan`

Parameter	Description
<vlan-id>	VLAN ID in the range <1-4090>

**Default** The native VLAN for the data plane ports is VLAN 1 by default.

**Mode** Global Configuration

**Example** To specify VLAN 100 as a native VLAN for the data plane ports:

```
awplus# configure terminal
awplus(config)# openflow native vlan 100
```

To change the native VLAN for the data plane ports back to the VLAN 1:

```
awplus# configure terminal
awplus(config)# no openflow native vlan
```

**Related commands** [show openflow config](#)

**Command changes**

- Version 5.4.6-1.1: command added
- Version 5.4.7-1.1: command added to GS900MX, XS900MX, x550 series products
- Version 5.4.7-2.1: command added to IE300, IE500 series products
- Version 5.4.8-0.2: added to SBx908 GEN2
- Version 5.4.8-1.1: added to IE210L series products

# openflow ssl peer certificate

**Overview** Use this command to enable a peer certificate to be sent from the machine that the OpenFlow Controller is running.

Use the **no** variant of this command to disable a peer certificate from being sent from the machine that the OpenFlow Controller is running.

**Syntax** `openflow ssl peer certificate {<file>|bootstrap}`  
`no openflow ssl peer certificate`

Parameter	Description
<code>&lt;file&gt;</code>	The CA certificate of an OpenFlow Controller must be in PEM format and specified with an absolute path using the format <code>flash:cacert.pem</code> . You must copy the file from the machine on which the OpenFlow Controller is running beforehand to the OpenFlow switch.
<code>bootstrap</code>	In bootstrap mode, when the switch first connects to the OpenFlow Controller, it accepts and saves to RAM a self-signed CA certificate sent from the Controller. Thereafter, the OpenFlow switch will only connect to OpenFlow Controllers signed by the same CA certificate.

**Default** Peer certificate validation is disabled by default.

**Mode** Global Configuration

**Usage notes** This command enables or disables peer certification on an OpenFlow Controller.

**Example** To validate a peer certificate using the bootstrap mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow ssl peer certificate bootstrap
```

To disable peer certificate validation, use the commands:

```
awplus# configure terminal
awplus(config)# no openflow ssl peer certificate
```

**Related commands** [show openflow ssl](#)

**Command changes** Version 5.4.7-1.1: command added  
Version 5.4.7-2.1: command added to IE300, IE500 series products  
Version 5.4.8-0.2: added to SBx908 GEN2  
Version 5.4.8-1.1: added to IE210L series products

# openflow ssl trustpoint

**Overview** Use this command to configure the local trustpoint to be used for authentication. Use the **no** variant of this command to disable the local trustpoint.

**Syntax** `openflow ssl trustpoint local`  
`no openflow ssl trustpoint local`

**Default** There is no trustpoint configured by default.

**Mode** Global Configuration mode.

**Usage notes** Use this command to specify a local self-signed certificate authority trustpoint for authentication. You must first create the trustpoint using the **crypto pki trustpoint** command.

**Example** To configure a local trustpoint, use the commands:

```
awplus# configure terminal
awplus(config)# openflow ssl trustpoint local
```

To delete the local trustpoint, use the command:

```
awplus(config)# no openflow ssl trustpoint
```

**Related commands** [openflow controller](#)

Version 5.4.8-0.2: added to SBx908 GEN2  
Version 5.4.8-1.1: added to IE210L series products

# openflow version

**Overview** Use this command to change the supported OpenFlow version numbers on the switch. You can specify a list of version numbers.

Use the **no** variant of this command to change the version number of the OpenFlow protocol back to the default version 1.3.

**Syntax** `openflow version <version-list>`  
`no openflow version`

Parameter	Description
<code>&lt;version-list&gt;</code>	Specifies a list of version numbers separated by a space. The version numbers are 1.0 and 1.3.

**Default** The OpenFlow version is set to 1.3 by default.

**Mode** Global Configuration

**Usage notes** This command overwrites any previously configured OpenFlow versions with the default OpenFlow version 1.3.

**Example** To change the OpenFlow protocol version to 1.0 and 1.3:

```
awplus(config)# openflow version 1.0 1.3
```

To change the OpenFlow protocol version to the default 1.3:

```
awplus(config)# no openflow version
```

**Related commands** [show openflow config](#)

**Command changes**

# show openflow config

**Overview** Use this command to display the OpenFlow configuration database on the switch.

**Syntax** show openflow config

**Mode** User Exec/Privileged Exec

**Example** To show the contents of the OpenFlow configuration database on the switch:

```
awplus# show openflow config
```

**Output** Figure 55-1: Example output from **show openflow config**

```
awplus# show openflow config
258a3d74-d349-4d18-9d75-09ab66e19d81
 Bridge of0
 Controller "tcp:192.168.1.2:6653"
 is_connected: true
 fail_mode: standalone
 Port of0
 Interface of0
 type: internal
 Port port1.0.4
 Interface port1.0.4
 type: system
 options: {ifindex="5004", mtu="1500", native_vlan="4090"}
 Port port1.0.8
 Interface port1.0.8
 type: system
 options: {ifindex="5008", mtu="1500", native_vlan="4090"}
...
```

Table 55-1: Parameters in the output from **show openflow config**

Parameter	Description
First line	The switch ID
Bridge of0	The configuration of the OpenFlow bridge.
Controller	The address of the OpenFlow Controller and SSL port number
is_connected: true	Indicates that the switch is connected to the OpenFlow Controller. If the switch is not connected to the Controller, "is_connected" is not displayed.

Table 55-1: Parameters in the output from **show openflow config** (cont.)

Parameter	Description
fail_mode	The fail mode. When the fail mode is "secure," OpenFlow on the switch does not set up flows when the OpenFlow Controller fails. When the fail mode is "standalone", OpenFlow on the switch sets up flows to work as a Layer 2 switch when the OpenFlow Controller fails.
Port	The port information
Interface	The interface of the port.
type:	The type of the port
options:	The options for the port

# show openflow coverage

**Overview** Use this command to display the OpenFlow counters from the Open vSwitch.

**Syntax** show openflow coverage

**Mode** User Exec/Privileged Exec

**Usage** The information displayed by this command is for troubleshooting. Contact Allied Telesis Technical Support for assistance.

**Example** To show OpenFlow counters:

```
awplus# show openflow coverage
```

**Output** Figure 55-2: Example output from **show openflow coverage**

```
awplus# show openflow coverage
Event coverage, avg rate over last: 5 seconds, last minute, last hour,

72 events never hit				

Table 55-2: Parameters in the output from

Parameter	Description
Event coverage	The name of a coverage event
avg rate over last: 5 seconds	The rate at which the event occurred for the last 5 seconds
last minute	The rate at which the event occurred for the last one minute
last hour	The rate at which the event occurred for the last one hour
hash	The name of the internal hash on the counter
total:	The total number of occurrences of the event
events never hit	The number of coverage events that have never occurred. When the value is 0, this information is not displayed.

# show openflow flows

**Overview** Use this command to display all the entries in the switch's flow tables that resulted from receiving packets on OpenFlow ports.

**Syntax** `show openflow flows`

**Mode** Privileged Exec

**Usage notes** The switch uses OpenFlow rules from the Controller to create a rule table that tells the switch what to do with packets. From the rules, the switch creates a software flow table to process packets. From the software flow table, the switch creates entries in its silicon hardware flow tables, when possible. When silicon table entries exist, the switch uses them to switch packets. When silicon table entries do not exist, the switch uses the software flow table to process packets.

See the "Communication and Packet Processing" section of the OpenFlow Feature Overview and Configuration Guide for a detailed explanation of how the switch puts entries into the software and silicon flow tables.

This command displays flows in both the software and silicon flow tables. A symbol at the start of each flow output indicates whether it is a silicon or software table entry:

- # indicates silicon flow table entries, and
- ~ indicates software flow table entries

**Example** To show the entries of the flow tables on the switch:

```
awplus# show openflow flows
```

**Output** Where possible, the switch uses OpenFlow rules from the Controller to create entries in its silicon hardware flow tables, and switches packets according to the silicon flow tables.

In the following example output, the OpenFlow ports are port1.0.14, port1.0.15, port1.0.16, port1.0.33 and sa3 (port1.0.27 and port1.0.38). As LOCAL and LAG ports are now supported, the first OpenFlow port number is used as the local port.

OpenFlow port numbering becomes:

- port1.0.14 is OpenFlow port number 2
- port1.0.15 is OpenFlow port number 3
- port1.0.33 is OpenFlow port number 5
- sa3 is OpenFlow port number 6

The clients are connected to port1.0.15 and port1.0.33 in this scenario and sa3 is used as OpenFlow ports for the uplink. The **show openflow flows** command shows the following:

Figure 55-3: Example output from **show openflow flows**

```
awplus# show openflow flows

~recirc_id(0),in_port(3),eth(src=08:00:27:9a:b6:7f,dst=08:00:27:4b:ef:3b),eth_type(0x0800),ipv4(frag=no), packets:0, bytes:0, used:never, actions:push_vlan(vid=79,pcp=0),6

~recirc_id(0),in_port(6),eth(dst=08:00:27:96:2d:48),eth_type(0x8100),vlan(vid=79,pcp=0),encap(eth_type(0x0806)), packets:1, bytes:64, used:8.990s, actions:pop_vlan,5

~recirc_id(0),in_port(6),eth(dst=08:00:27:9a:b6:7f),eth_type(0x8100),vlan(vid=79,pcp=0),encap(eth_type(0x0800),ipv4(frag=no)), packets:1, bytes:346, used:3.938s, actions:pop_vlan,3

#recirc_id(0),in_port(6),eth(dst=ff:ff:ff:ff:ff:ff/01:00:00:00:00:00),eth_type(0x0800),ipv4(frag=no), packets:28, bytes:2019, used:2.110s, actions:drop

```

**NOTE:** This output includes added line spacing for readability purposes

Table 55-3: Parameters in the output from **show openflow flows**

Parameter	Description
recirc_id	Used to select the next packet processing steps among multiple instances of recirculation. Packets initially enter the process with an ID of 0, which indicates no recirculation.
in_port	The OpenFlow port number
eth	The source and destination MAC address of the packet
eth_type	The Ethernet type
ipv4	The information in the IPv4 header
packets	The number of matched packets
bytes	The number of matched bytes
actions	A set of actions for the packets that match the key

Table 55-4: Parameters in the output from **show openflow rules**

Parameter	Description
duration	The duration of the flow entry in seconds
n_packets	The number of packets that match the flow entry
n_bytes	The number of bytes that match the flow entry
priority	The priority of the flow entry
in_port	The OpenFlow port number on which the packets are received
dl_src	The source address
dl_dst	The destination address
actions	A set of actions applied to a packet. The actions are: "drop", "goto_table", "pop_vlan", or "push_vlan"
table_id	The table ID of the flow entry

# show openflow ssl

**Overview** Use this command to display the current SSL configuration for OpenFlow.

**Syntax** `show openflow ssl`

**Mode** Privileged Exec

**Usage notes** This command displays the current SSL configuration for OpenFlow.

**Example** To display the current SSL configuration for OpenFlow, use the command:

```
awplus# show openflow ssl
```

**Output** Figure 55-5: Example output from **show openflow ssl**

```
awplus#show openflow ssl
Private key: /flash/.certs/pki/local/cakey.pem
Certificate: /flash/.certs/pki/local/cacert.pem
CA Certificate: /etc/openvswitch/cacert.pem
Bootstrap: true
```

# show openflow status

**Overview** Use this command to display the status of each data plane port and the OpenFlow protocol messages queried by the OpenFlow Controller.

**Syntax** show openflow status

**Mode** Privileged Exec

**Example** To show the status of a switch with four OpenFlow ports, enter the command:

```
awplus# show openflow status
```

**Output** Figure 55-6: Example output from **show openflow status**

```
awplus#show openflow status

```

Table 55-5: Parameters in the output from **show openflow status**

Parameter	Description
OFPT_FEATURES_REPLY (OF1.3) (xid=0x2):	Indicates that the following information is from the OpenFlow version 1.3 Feature reply.
dpid:	The datapath ID
n_tables	The number of tables supported by the switch
n_buffers	The maximum number of packets that the switch can buffer when sending packets to the OpenFlow controller
capabilities	A list of the OpenFlow capabilities: FLOW_STATS (flow statistics), TABLE_STATS (table statistics), PORT_STATS (port statistics), IP_REASM (IP fragments reassemble), QUEUE_STATS (queue statistics), and GROUP_STATS (group statistics)
OFPT_PORT_DESC replay (OF1.3) (xid=0x3):	Indicates that the following information is from the OpenFlow version 1.3 Port Description Reply.
1 (port1.0.1): addr:ec:cd:6d:c4: 21:bd	The port number and MAC address.
config:	The port status: 0 (the port is up) or PORT_DOWN (the port is down.)
state:	The link status: 0 (the link is up) or LINK_DOWN (the link is down.)
current:	The current feature status.
supported:	A list of the supported features: 1GB-FD, 10GB-FD, AUTO-NEG, etc. Not displayed from software release 5.4.7 onwards for interfaces that do not have this capability, i.e. static LAG interfaces or the of0 bridge interface.
speed:	The current port speed and maximum speed.
OFPT_GET_CONFIG_REPLY (OF1.3) (xid=0x5):	Indicates that the switch responds to a configuration request by an OFPT_GET_CONFIG_REPLY message with the following information.

Table 55-5: Parameters in the output from **show openflow status** (cont.)

Parameter	Description
frags:	The action for the IP fragments: normal, dropped, or reassembled. Normal means that an attempt should be made to pass the fragments through the OpenFlow tables.
miss_send_len=0:	The number of bytes of each packet that was sent to the OpenFlow controller when a flow table fails or reaches the controller

# 56

# MACsec Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure MACsec (Media Access Control Security) and the MACsec Key Agreement protocol (MKA).

MACsec provides line-rate encryption and protection of traffic passing over a Layer 2 network or link. It protects all frames passing over the link, including Layer 2 protocols such as ARP.

For more information, see the [MACsec Feature Overview and Configuration Guide](#).

- Command List**
- “clear macsec counters” on page 2867
  - “clear mka sessions” on page 2868
  - “crypto random bytes” on page 2869
  - “key-server priority” on page 2870
  - “macsec replay-protection” on page 2871
  - “macsec-cipher-suite” on page 2872
  - “mka policy (global)” on page 2873
  - “mka policy (interface)” on page 2875
  - “mka pre-shared-key” on page 2877
  - “platform macsec enable” on page 2879
  - “show macsec” on page 2881
  - “show mka policy” on page 2890

# clear macsec counters

**Overview** Use this command to clear MACsec packet counters for the given interface or for all interfaces.

These are the statistics displayed in the output from [show macsec](#).

**Syntax** `clear macsec counters [interface <interface-list>]`

Parameter	Description
<code>interface</code> <code>&lt;interface-list&gt;</code>	The interfaces to clear statistics for: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4).</li></ul>

**Mode** Privileged Exec

**Example** To clear MACsec packet counters for port1.0.1, use the command:

```
awplus# clear macsec counters interface port1.0.1
```

To clear MACsec packet counters for all interfaces, use the command:

```
awplus# clear macsec counters
```

**Related commands** [show macsec](#)

**Command changes** Version 5.4.9-2.1: command added

# clear mka sessions

**Overview** Use this command to restart MKA sessions. Note that this will cause a traffic disruption until the MKA sessions re-establish.

**Syntax** `clear mka sessions [interface <interface-list>]`

Parameter	Description
<code>interface</code> <code>&lt;interface-list&gt;</code>	The interfaces to clear MKA sessions for: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4).</li></ul>

**Mode** Privileged Exec

**Example** To clear the MKA session on port1.0.1, use the command:

```
awplus# clear mka sessions interface port1.0.1
```

To clear all MKA sessions for all interfaces, use the command:

```
awplus# clear mka sessions
```

**Related commands** [mka policy \(global\)](#)  
[mka policy \(interface\)](#)  
[show mka policy](#)

**Command changes** Version 5.4.9-2.1: command added

# crypto random bytes

**Overview** Use this command to generate a cryptographically secure random number in hexadecimal format and print it to the console.

**Syntax** `crypto random bytes <1-32>`

Parameter	Description
<code>bytes &lt;1-32&gt;</code>	The length of the random number to generate in bytes. Each byte is represented by 2 hexadecimal digits in the output.

**Mode** Privileged Exec

**Usage notes** You can use this command to generate keys for symmetric encryption algorithms such as Advanced Encryption Standard (AES). You can also use this to generate strong passwords.

This command prints a random number to the console; it does not automatically store or configure anything. You can copy the command output into other configuration commands.

For example, the MACsec Key Agreement protocol requires a 128-bit (16-byte) pre-shared key, known as the Secure Connectivity Association Key (CAK). You can use this command to generate a 16-byte key and then copy it into the [mka pre-shared-key](#) command.

**Example** To generate a 128-bit (16-byte) key, use the command:

```
awplus# crypto random bytes 16
```

A 16 byte key will be printed to the console as a 32-digit hexadecimal number.

**Related commands** [mka policy \(interface\)](#)  
[mka pre-shared-key](#)

**Command changes** Version 5.4.9-2.1: command added

# key-server priority

**Overview** Use this command to adjust the key server priority advertised in MKA.  
Use the **no** variant of this command to reset the key server priority to the default.

**Syntax** `key-server priority <0-255>`  
`no key-server priority`

Parameter	Description
<0-255>	The priority for this device to become the key server, in the range 0 to 255. Lower values are higher priority.

**Default** 128

**Mode** MKA Policy Configuration

**Usage notes** If both peers are configured with the same key server priority value, the MKA peer transmitting on the channel with the lowest Secure Channel Identifier (SCI) will be chosen as the key server. The SCI is made up of the MAC address followed by a port identifier.

**Example** To configure this MKA peer to advertise the highest priority to become the key server for MKA policy 'office', use the commands:

```
awplus# config terminal
awplus(config)# mka policy office
awplus(config-mka-policy)# key-server priority 0
```

To reset the device to default key server priority of 128, use the commands:

```
awplus# config terminal
awplus(config)# mka policy office
awplus(config-mka-policy)# no key-server priority
```

**Related commands** [macsec replay-protection](#)  
[mka policy \(global\)](#)  
[show mka policy](#)

**Command changes** Version 5.4.9-2.1: command added

# macsec replay-protection

**Overview** Use this command to enable replay protection and set the size of the replay protection window for the MKA policy. When replay protection is enabled, MACsec drops frames that are too far out of the expected order, as specified by the window size.

Use the **no** variant of this command to disable replay protection.

**Syntax** `macsec replay-protection window-size <0-4294967295>`  
`no macsec replay-protection`

Parameter	Description
<code>window-size</code> <code>&lt;0-4294967295&gt;</code>	The size of the MACsec replay protection window, in frames. A window-size of 0 (zero) means MACsec will not allow any frame re-ordering. That is, it drops any frames it receives with packet numbers earlier than the next expected packet number.

**Default** By default, replay protection is enabled and the window size is 0.

**Mode** MKA Policy Configuration

**Usage notes** We recommend using the default setting for replay protection unless you expect legitimate frame reordering on the link.

**Example** To enable MACsec replay protection with window size 0 for MKA policy 'office', use the following commands:

```
awplus# configure terminal
awplus(config)# mka policy office
awplus(config-mka-policy)# macsec replay-protection
window-size 0
```

To disable replay protection for MKA policy 'office', use the commands:

```
awplus# config terminal
awplus(config)# mka policy office
awplus(config-mka-policy)# no macsec replay-protection
```

**Related commands** [key-server priority](#)  
[mka policy \(global\)](#)  
[show mka policy](#)

**Command changes** Version 5.4.9-2.1: command added

# macsec-cipher-suite

**Overview** Use this command to set the cipher suite MACsec uses to encrypt and decrypt MACsec-protected frames. The only cipher suite supported is GCM-AES-128.

**Syntax** `macsec-cipher-suite gcm-aes-128`

Parameter	Description
<code>gcm-aes-128</code>	Cipher suite GCM-AES-128. This is the only option supported.

**Default** GCM-AES-128

**Mode** MKA Policy Configuration

**Usage notes** You do not need to enter this command because it is included in each MKA policy by default and it only has one possible value.

**Example** To set the cipher suite for MKA policy 'our-policy' to GCM-AES-128, use the commands:

```
awplus# configure terminal
awplus(config)# mka policy our-policy
awplus(config-mka-policy)# macsec-cipher-suite gcm-aes-128
```

**Related commands**

- [key-server priority](#)
- [macsec replay-protection](#)
- [mka policy \(global\)](#)
- [mka policy \(interface\)](#)
- [show mka policy](#)

**Command changes** Version 5.4.9-2.1: command added

# mka policy (global)

**Overview** Use this command to create an MKA (MACsec Key Agreement protocol) policy and to enter MKA Policy Configuration mode to configure the policy.

Use the **no** variant of this command to delete the named MKA policy. The policy must first be removed from any interface that uses it. You cannot delete the default policy.

**Syntax** `mka policy <policy-name>`  
`no mka policy <policy-name>`

Parameter	Description
<code>&lt;policy-name&gt;</code>	The name of the MKA policy to be created or deleted. MKA policy names are case insensitive and can be up to 64 characters long composed of printable ASCII characters. Profile names can have only letters from a to z and A to Z, numbers from 0 to 9, - (dash), or _ (underscore).

**Default** By default, there is one MKA policy named 'default'. You can add this policy to a port; you cannot change its configuration or delete the policy.

**Mode** Global Configuration

**Usage notes** To protect the layer 2 traffic between the peers:

- Enable MACsec on the device ([platform macsec enable](#)) and restart the device before you can configure MACsec or MKA.
- First create and configure an MKA policy (**mka policy (global)**) or use the default policy and then set the interface to use this policy ([mka policy \(interface\)](#)). Optionally, configure [macsec replay-protection](#) and [key-server priority](#).
- Create a pre-shared key and add it to the interface ([mka pre-shared-key](#)).
- Limit bandwidth to prevent loss of important control packets on the interface (for instance, [egress-rate-limit](#)).

For more information about MACsec and how to configure it, see the [MACsec Feature Overview and Configuration Guide](#).

**Example** To create an MKA policy named 'office', and enter MKA Policy mode to configure it, use the commands:

```
awplus# configure terminal
awplus(config)# mka policy office
```

To delete the MKA policy from the device, use the commands:

```
awplus# configure terminal
awplus(config)# no mka policy our-policy
```

**Related  
commands**

egress-rate-limit  
key-server priority  
macsec replay-protection  
mka policy (interface)  
mka pre-shared-key  
platform macsec enable  
show mka policy

**Command  
changes**

Version 5.4.9-2.1: command added  
Version 5.5.1-1.1: support added for XEM2-12XS v2 and XEM2-8XSTm

# mka policy (interface)

**Overview** Use this command to set the MKA policy for the interface to use for MACsec, and to enable MACsec on the interface. All traffic except EAPOL traffic will be blocked and MKA will begin. The switch will create SCs and SAs from SAKs negotiated via MKA and traffic will then be forwarded and encrypted.

Use the **no** variant of this command to disable MACsec on the interface and remove an MKA policy from the interface. The policy name does not need to be given.

**Syntax** `mka policy <policy-name>`  
`no mka policy`

Parameter	Description
<code>&lt;policy-name&gt;</code>	The name of the MKA policy to be enabled or disabled. Only one MKA policy can be added to an interface.

**Default** By default, there is one MKA policy named 'default'. You can add this policy to a port; you cannot change its configuration or delete the policy.

**Mode** Interface Configuration

**Usage notes** To protect the layer 2 traffic between the peers:

- Enable MACsec on the device ([platform macsec enable](#)) and restart the device before you can configure MACsec or MKA.
- First create and configure an MKA policy ([mka policy \(global\)](#)) or use the default policy and then set the interface to use this policy (**mka policy (interface)**). Optionally, configure [macsec replay-protection](#) and [key-server priority](#).
- Create a pre-shared key and add it to the interface ([mka pre-shared-key](#)).
- Limit bandwidth to prevent loss of important control packets on the interface (for instance, [egress-rate-limit](#)).

For more information about MACsec and how to configure it, see the [MACsec Feature Overview and Configuration Guide](#).

**Example** To add the MKA policy 'office' to port1.0.1, use the commands:

```
awplus(config)# interface port1.0.1
awplus(config-if)# mka policy office
```

To remove the MKA policy from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no mka policy
```

**Related  
commands**

egress-rate-limit  
key-server priority  
macsec replay-protection  
mka policy (global)  
mka pre-shared-key  
platform macsec enable  
show mka policy

**Command  
changes**

Version 5.4.9-2.1: command added  
Version 5.5.1-1.1: support added for XEM2-12XS v2 and XEM2-8XSTm

# mka pre-shared-key

**Overview** Use this command to set the pre-shared Secure Connectivity Association Key (CAK) and CAK name (CKN) that MKA uses on the interface.

Use the **no** variant of this command to remove the pre-shared key from the interface.

**Syntax** `mka pre-shared-key ckn <varname> cak <varname>`  
`no mka pre-shared-key`

Parameter	Description
<code>ckn &lt;varname&gt;</code>	The CAK name to go with the CAK. An arbitrary value from 2 to 64 hexadecimal digits long (an even number of digits representing 1 to 32 bytes). It must not in any way be derived from any part of the CAK itself, as this would seriously undermine protection. Each CAK configured on the device should have a unique name.
<code>cak &lt;varname&gt;</code>	The Secure Connectivity Association Key (CAK) to be used by MKA on the port, in hexadecimal format. The CAK length must be 32 hexadecimal characters, representing 16 bytes. The CAK must be a cryptographically secure random number.

**Default** By default, there are no pre-shared keys configured.

**Mode** Interface Configuration

**Usage notes** MKA uses the pre-shared key to protect MACsec traffic between the peers.

To generate a new cryptographically-secure random CAK to use in this command, we recommend you use the [crypto random bytes](#) command.

The running configuration will not display the CAK in plain text—it will show a different number. However, we recommend limiting access to authorized eyes only.

The pre-shared CAK and CKN must be the same on both MACsec peers.

**Example** To configure the pre-shared CAK and CKN on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# mka pre-shared-key ckn <cak-name> cak <cak>
```

To remove the pre-shared CAK and CKN from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no mka pre-shared-key
```

**Related commands** [crypto random bytes](#)  
[mka policy \(global\)](#)  
[mka policy \(interface\)](#)

**Command changes** Version 5.4.9-2.1: command added

# platform macsec enable

**Overview** Use this command to enable hardware support for MACsec.

Use the **no** variant of this command to disable hardware support for MACsec (default).

The device must be rebooted for either enabling or disabling to take effect.

**Syntax** platform macsec enable  
no platform macsec enable

**Default** Disabled

**Mode** Global Configuration

**Usage notes** Before you enter any other MACsec configuration, you must first enable hardware support for MACsec with this command (**platform macsec enable**) and then restart the device.

If you disable hardware support for MACsec (**no platform macsec enable**) and then reboot the device, no MACsec configuration can be entered manually or by configuration script.

**Example** To enable hardware support for MACsec, use the commands:

```
awplus# configure terminal
awplus(config)# platform macsec enable
awplus(config)# exit
awplus# copy running-config startup-config
awplus# reboot
reboot system? (y/n): y
```

To disable hardware support for MACsec, use the following commands. After the device has restarted, hardware support will be disabled.

```
awplus# configure terminal
awplus(config)# no platform macsec enable
awplus(config)# exit
awplus# copy running-config startup-config
awplus# reboot
reboot system? (y/n): y
```

**Related commands** copy running-config  
mka policy (global)  
mka policy (interface)  
reboot

show macsec

**Command  
changes**

Version 5.4.9-2.1: command added

Version 5.5.1-1.1: support added for XEM2-12XS v2 and XEM2-8XSTm (ports 5-8)

# show macsec

**Overview** Use this command to display MKA and MACsec information and statistics for specified interfaces or for all interfaces.

**Syntax** `show macsec [interface <interface-list>]`

Parameter	Description
<code>interface</code> <code>&lt;interface-range&gt;</code>	The interfaces or range of interfaces for which to display information: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4).</li></ul>

**Mode** Privileged Exec

**Example** To display information about port1.0.1, use the command:

```
awplus# show macsec interface port1.0.1
```

To display information about all interfaces, use the command:

```
awplus# show macsec
```

**Output** Figure 56-1: Example output from **show macsec**

```
awplus#show macsec interface port1.0.1

MKA and MACsec information for interface port1.0.1:

MKA:

 Active: True
 MACsec Protection Mode: Integrity and confidentiality
 Actor SCI: eccd.6ddf.6db1/1389
 Actor Priority: 128
 Key Server SCI: eccd.6ddf.6db1/1389
 Key Server Priority: 128
 Keys Distributed: 1
 Keys Received: 0
```

```
General MACsec Info:

State: OK
Current Cipher Suite: GCM-AES-128
Cipher Suite Protection: Integrity and confidentiality

Input Data Pkts (Allowed): 3
Input Data Pkts (Blocked): 0
Input EAPOL Pkts: 2

Output Data Pkts (OK): 5
Output Data Pkts (Error): 0
Output EAPOL Pkts: 26

 Pkts OK: 3
 Pkts Invalid (Allowed): 0
 Pkts Invalid (Blocked): 0

```

Table 56-1: Parameters in the output from **show macsec**

Parameter	Description
<b>MKA</b>	Information about the MACsec Key Agreement protocol.
Active	This is "True" when MKA is active and currently sending MKA messages out the port. It may be "False" for the following reasons: <ul style="list-style-type: none"> <li>MKA is not fully configured. Check that both <a href="#">mka policy (interface)</a> and <a href="#">mka pre-shared-key</a> are configured on the port.</li> <li>MACsec is not licensed. Check the <a href="#">show license external</a> command to see whether MACsec is licensed.</li> </ul>
MACsec Protection Mode	The MACsec protection mode that the key server has chosen. Only 'Integrity and confidentiality' is supported by AlliedWare Plus. This will show 'Undecided' when a key server has not been elected.
Actor SCI	The Secure Channel Identifier (SCI) of this device (automatically assigned, based on the MAC address).
Actor Priority:	This device's priority value for key server election, as set by the <a href="#">key-server priority</a> command. This is compared with the peer's priority to decide which device will be the key server. Lower values represent higher priorities so the highest priority is zero and the lowest priority is 255.
Key Server SCI	The Secure Channel Identifier (SCI) of the device that has been elected to be the key server. This will display "-" when a key server has not been elected.

Table 56-1: Parameters in the output from **show macsec** (cont.)

Parameter	Description
Key Server Priority	The priority of the device that has been elected to be the key server. This will display "-" when a key server has not been elected.
Keys Distributed	How many Secure Association Keys (SAKs) this device has transmitted to the peer.
Keys Received	How many Secure Association Keys (SAKs) this device has received from the peer.
<b>General MACsec Info</b>	General information about the MACsec processing of traffic.
State	This displays 'OK' when the necessary settings have been applied to hardware. That is, the channels and SAs have been added and it is using the cipher suite and MACsec protection mode that AlliedWare Plus supports. Otherwise, it displays 'Bad' and MACsec protection is not working.
Current Cipher Suite	The cipher suite that is being used for encryption/decryption and verification of MACsec frames. AlliedWare Plus only supports GCM-AES-128. This will show "-" when the key server has not been elected or it has chosen settings that the device does not support.
Cipher Suite Protection	The cipher suite protection mode that is currently being used. AlliedWare Plus only supports "Integrity and confidentiality". That means frames are protected from modification and the payload is encrypted. This will show "-" when the key server has not been elected or it has chosen settings that the device doesn't support.
Input Data Pkts (Allowed)	The number of ingress frames that have been allowed through the port. This does not include EAPOL frames that have bypassed MACsec verification; they are counted separately under "Input EAPOL Pkts".
Input Data Pkts (Blocked)	The number of ingress frames that have been discarded. This should not be going up during normal operation.
Input EAPOL Pkts	The number of ingress EAPOL frames (including MKA) that have bypassed MACsec verification. If this is not going up then the device is not receiving MKA messages from the peer. See the <a href="#">show auth statistics interface</a> command for a counter that includes only MKA messages.
Output Data Pkts (OK)	The number of egress frames that have been allowed through the port. This does not include EAPOL frames sent by this device; they are counted separately under "Output EAPOL Pkts".

Table 56-1: Parameters in the output from **show macsec** (cont.)

Parameter	Description
Output Data Pkts (Error)	This is the same value as "Frame Generation" -> "Pkts Too Long". This does not include frames discarded when MACsec is blocking the port or when the link is oversubscribed.
Output EAPOL Pkts	The number of egress EAPOL frames sent by this device. EAPOL frames sent by this device are never encapsulated in MACsec.
<b>Frame Generation</b>	Information about MACsec processing of egress frames.
Protect Frames	This will always be "True". It means that outgoing traffic will be encapsulated in MACsec frames.
Always Include SCI	This will always be "True". It means that the Secure Channel Identifier is always included in outgoing MACsec frames.
Pkts Untagged	This will always be '0' (zero). MACsec sends no unprotected frames.
Pkts Too Long	The number of egress frames that were discarded during MACsec processing because they were too big. This does not include frames that were discarded due to exceeding the MRU configured on the port because that happens before MACsec processing.
Bytes Protected Only	The number of bytes that have been included inside MACsec encapsulation without encryption. This will always be '0' (zero) because AlliedWare Plus only supports encrypted MACsec frames.
Bytes Encrypted	The number of bytes that have been encrypted for MACsec encapsulation.
<b>Frame Verification</b>	Information about MACsec processing of ingress frames.
Validate Frames	This is always "Strict".
Replay Protect	This is "True" if replay protection is enabled and "False" if replay protection is disabled. This will match what has been configured with the <a href="#">macsec replay-protection</a> command.
Replay Window	The size of the replay protection window, as set by the <a href="#">macsec replay-protection</a> command.

Table 56-1: Parameters in the output from **show macsec** (cont.)

Parameter	Description
Pkts Untagged (Allowed)	The number of ingress frames that were allowed through the port even though they did not have MACsec encapsulation. This will always be zero because AlliedWare Plus only supports "Strict" validation. This does not include EAPOL frames that have bypassed MACsec verification.
Pkts Untagged (Blocked)	The number of ingress frames that were discarded because they did not have MACsec encapsulation. This does not include EAPOL frames that have bypassed MACsec verification.
Pkts Bad Tag	The number of ingress frames that were discarded because the MACSec tag (SecTAG) contained invalid information.
Pkts Unknown SCI (Allowed)	The number of ingress frames that were allowed through the port even though they could not be matched to a receive channel. This will always be zero because AlliedWare Plus only supports "Strict" validation.
Pkts Unknown SCI (Blocked)	The number of ingress frames that were discarded because they could not be matched to a receive channel. This could happen for one of the following reasons: <ul style="list-style-type: none"> <li>• A Secure Channel Identifier (SCI) was not included in the MACsec tag (SecTAG).</li> <li>• The SCI in the SecTAG did not match the receive channel.</li> </ul>
Pkts Overrun	The number of ingress frames that were discarded due to performance limitations of MACsec validation.
Bytes Validated Only	The number of non-encrypted bytes encapsulated inside MACsec frames that have gone through integrity checking. This includes frames that get discarded due to failing the integrity check or another check that is performed afterwards. This does not include the MAC addresses, SecTAG or ICV.
Bytes Decrypted	The number of encrypted bytes encapsulated inside MACsec frames that have gone through integrity checking and decryption. This includes frames that get discarded due to failing the integrity check or another check that is performed afterwards.
<b>Transmit Channel</b> <secure-channel-identifier>	Information about the Secure Channel used for transmitting frames to the peer. The peer device should have a receive channel with the same Secure Channel Identifier.
Created Time	When the transmit channel was created.

Table 56-1: Parameters in the output from **show macsec** (cont.)

Parameter	Description
Pkts Protected Only	The number of MACsec-protected frames transmitted through this channel without encryption. This will always be zero.
Pkts Encrypted	The number of MACsec-protected frames transmitted through this channel with encryption.
<b>Secure Association</b> <association-number>	Information about a Secure Association (SA) that belongs to the transmit channel. The peer device should have an SA on its receive channel with the same association number and key identifier.
Key Identifier	An identifier for the Secure Association Key (SAK) part of this Secure Association. This is not the key itself.
Created Time	When this Secure Association was created. The SA will usually become operational (as indicated by "In Use") a few seconds after it has been created.
In Use	This is "True" if the Secure Association is installed in hardware and is operational.
Next Packet Number	This value, expressed in hexadecimal, will be used as the packet number in the next MACsec frame that's generated with this SA. This starts at 0x00000001 when the SA is first created and increases by one for each frame sent. The process of changing SAKs should start once this reaches 0xC0000000. The maximum possible value is 0xFFFFFFFF.
Pkts Protected Only	The number of MACsec-protected frames transmitted with this Secure Association without encryption. This will always be zero.
Pkts Encrypted	The number of MACsec-protected frames transmitted with this Secure Association with encryption.
<b>Receive Channel</b> <secure-channel-identifier>	Information about a Secure Channel used for receiving frames from a peer.
Created Time	When the receive channel was created.
Pkts OK	The number of MACsec-protected frames that passed all validation checks and were allowed through the port. This counter only includes frames received through this channel.
Pkts Unchecked	This will always be zero because AlliedWare Plus only supports "Strict" validation.

Table 56-1: Parameters in the output from **show macsec** (cont.)

Parameter	Description
Pkts Invalid (Allowed)	The number of ingress frames that were allowed through the port even though they did not pass integrity protection checks. This will always be zero because AlliedWare Plus only supports "Strict" validation.
Pkts Invalid (Blocked)	The number of MACsec-protected frames that were discarded because they did not pass integrity protection checks. This counter only includes frames received through this channel.
Pkts Late (Allowed)	The number of MACsec-protected frames that were allowed through the port even though they did not pass the replay protection check. This counter only includes frames received through this channel. This depends on the setting of the <a href="#">macsec replay-protection</a> command.
Pkts Late (Blocked)	The number of MACsec-protected frames that were discarded because they did not pass the replay protection check. This counter only includes frames received through this channel. This depends on the setting of the <a href="#">macsec replay-protection</a> command.
<b>Secure Association</b> <association-number>	Information about a Secure Association (SA) that belongs to the receive channel.
Key Identifier	An identifier for the Secure Association Key (SAK) that part of this Secure Association. This is not the key itself.
Created Time	When this Secure Association was created. The SA will usually become operational (as indicated by "In Use") a few seconds after it has been created.
In Use	This is "True" if the Secure Association is installed in hardware and is operational.
Next Packet Number	The packet number that the device expects to receive next. This is one greater than highest packet number received so far.
Pkts OK	The number of MACsec-protected frames that passed all validation checks and were allowed through the port. This counter only includes frames received with this Secure Association.

Table 56-1: Parameters in the output from **show macsec** (cont.)

Parameter	Description
Pkts Invalid (Allowed)	The number of ingress frames that were allowed through the port even though they did not pass integrity protection checks. This will always be zero because AlliedWare Plus only supports "Strict" validation.
Pkts Invalid (Blocked)	The number of MACsec-protected frames that were discarded because they did not pass integrity protection checks. This counter only includes frames received with this Secure Association.

**Related commands**

- [show mka policy](#)

**Command changes**

- Version 5.4.9-2.1: command added

# show mka policy

**Overview** Use this command to display information about the named MKA policy or all MKA policies.

**Syntax** `show mka policy [<policy-name>]`

Parameter	Description
<code>&lt;policy-name&gt;</code>	The name of the MKA policy to display. If no policy name is specified, all MKA policies are displayed.

**Mode** Privileged Exec

**Example** To display settings for MKA policy 'office', use the command:

```
awplus# show mka policy office
```

To display all MKA policies, use the command:

```
awplus# show mka policy
```

**Output** Figure 56-2: Example output from **show mka policy**

```
awplus# show mka policy
MKA policy: default
 Key server priority: 128
 MACsec Cipher Suite: GCM-AES-128
 Replay protection: Enabled
 Replay window size: 0

MKA policy: office
 Key server priority: 100
 MACsec Cipher Suite: GCM-AES-128
 Replay protection: Enabled
 Replay window size: 20

MKA policy: test
 Key server priority: 200
 MACsec Cipher Suite: GCM-AES-128
 Replay protection: Disabled
```

Table 56-2: Parameters in the output from **show mka policy**

Parameter	Description
MKA policy	The name of the MKA policy; either 'default' or as named with the <a href="#">mka policy (interface)</a> command.
Key server priority	The priority for this device to be the keyserver for the MACsec link; in the range 0 to 255, as specified by the <a href="#">key-server priority</a> command. A lower number is a higher priority. The default is 128.
MACsec Cipher Suite	The cipher suite that MACsec uses for encapsulation and encryption of data: GCM-AES-128.
Replay protection	Whether replay protection is enabled or disabled, as set by the <a href="#">macsec replay-protection</a> command. When enabled, MACsec drops frames that arrive outside this window.
Replay window size	The size of the replay protection window in frames, as set by the <a href="#">macsec replay-protection</a> command. A value of 0 (zero) allows no frame reordering.

# Virtual Chassis Stacking (VCStack™) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for Virtual Chassis Stacking (VCStack™) commands.

For information on stacking, see [VCStack Feature Overview and Configuration Guide](#).

VCStack is not available in Secure Mode (see the [crypto secure-mode](#) command).

Also note the following stacking trigger commands that are documented in the Triggers chapter:

- [type stack disabled-master](#)
- [type stack master-fail](#)
- [type stack member](#)
- [type stack link](#)

In addition to the stacking commands shown in this chapter, stacking content also exists in the following commands:

- [hostname](#)
- [reboot](#)
- [reload](#)
- [show cpu](#)
- [show cpu history](#)
- [show exception log](#)
- [show file systems](#)
- [show memory](#)
- [show memory history](#)
- [show process](#)

- [show system](#)

**CAUTION:** Stack operation is only supported if **stack virtual-mac** is enabled. For more information refer to [stack virtual-mac](#).

**Command List**

# clear counter stack

**Overview** This command clears all stack counters for all stack members.

**Syntax** `clear counter stack`

**Mode** Privileged Exec

**Example** To clear all stack counters:

```
awplus# clear counter stack
```

**Related commands** [show counter stack](#)

# debug stack

**Overview** This command enables the stacking debugging facilities.

**Syntax** `debug stack [link|topology|trace]`  
`no debug stack [link|topology|trace]`

Parameter	Description
link	Stacking neighbor discovery events on stack links.
topology	Stacking topology discovery messages.
trace	Notable stacking events.

**Default** Stack trace debugging is enabled.

**Mode** Privileged Exec and Global Configuration

**Usage notes** The command displays debug information about the stacked devices. If no parameter is specified, all the stack debugging information will be displayed, including link events, topology discovery messages and all notable stacking events. If link parameter is specified, only the link events debugging information will be displayed.

**Examples** To enable debugging, enter the following command on the stack master:

```
awplus# debug stack
```

To enable link debugging, enter the following command on the stack master:

```
awplus# debug stack link
```

To enable topology discovery debugging, enter the following command on the stack master:

```
awplus# debug stack topology
```

To enable stack trace debugging, enter the following command on the stack master:

```
awplus# debug stack trace
```

**Related commands** [undebug stack](#)

# delete stack-wide force

**Overview** Use this command to delete files from all members of a stack.

**Syntax** `delete stack-wide force [recursive] <name>`

Parameter	Description
<code>recursive</code>	Delete directories that match the name, including their contents.
<code>&lt;name&gt;</code>	The name of the files or directories to delete. The filename can include the wildcard *. Use the wildcard with caution, because this command does not ask for confirmation before deleting files.

**Mode** Privileged Exec.

**Usage notes** This is a non-interactive command, so if the specified file or files exist, they are deleted without question or warning. This is indicated by the mandatory **force** parameter.

You can use this command within an AMF working set.

**Examples** To delete a file "test.scp" that is located in flash memory on all stack members, use the following command:

```
awplus# delete stack-wide force test.scp
```

To remove directories "output1" and "output2" from an external USB memory device on all stack members, use the following command:

```
awplus# delete stack-wide force recursive usb:output*
```

**Related commands** [cd](#)  
[dir stack-wide](#)

**Command changes** Version 5.4.7-0.1: command added.

# dir stack-wide

**Overview** This command lists the files on all stack members at once. If you don't specify a directory or file, then this command lists the files in the current directory.

**Syntax** `dir stack-wide [all] [recursive] [sort [reverse]] [name|size|time]] [<filename>|debug|flash|nvs|usb]`

Parameter	Description
all	List all files.
recursive	List the contents of directories recursively.
sort	Sort directory listing.
reverse	Sort using reverse order.
name	Sort by name.
size	Sort by size.
time	Sort by modification time (default).
<filename>	The name of the directory or file. If you don't specify a directory or file, then this command lists the files in the current directory.
debug	Debug root directory
flash	Flash memory root directory
nvs	NVS memory root directory
usb	USB storage device root directory

**Mode** Privileged Exec

**Usage notes** The **dir stack-wide** command behaves the same as the **dir** command, except for running on all stack members.

**Examples** To list the files in the current directory across all stack members, use the command:

```
awplus# dir stack-wide
```

To list files in the root flash directory across all stack members, use the command:

```
awplus# dir stack-wide flash
```

To list all files recursively in the root flash directory across all stack members, use the command:

```
awplus# dir stack-wide all recursive flash
```

To list the files in alphabetical order, use the command:

```
awplus# dir stack-wide sort name
```

To list the files by size, smallest to largest, use the command:

```
awplus# dir stack-wide sort reverse size
```

To sort the files by modification time, oldest to newest, use the command:

```
awplus# dir stack-wide sort reverse time
```

**Output** Figure 57-1: Example output from using the **dir stack-wide** command to list files that start with atmf

```
awplus#dir stack-wide atmf*

Stack member 1:
263 rw Nov 15 2017 15:22:52 flash:/atmfStableNodes.sh
3117 rw Nov 14 2017 13:26:31 flash:/atmf-find.sh
2346 rw Nov 14 2017 13:26:19 flash:/atmf-rec.sh

Stack member 2:
263 rw Nov 15 2017 15:22:52 flash:/atmfStableNodes.sh
3117 rw Nov 14 2017 13:26:31 flash:/atmf-find.sh
2346 rw Nov 14 2017 13:26:19 flash:/atmf-rec.sh
```

**Command changes** Version 5.4.8-0.2: command added.

# mac address-table vcs-sync-mode

**Overview** Use this command to allow a MAC address learnt on one stack member to be used on any other stack member. Note that this command is only necessary in unusual circumstances, as described in the Usage section below.

**Syntax** `mac address-table vcs-sync-mode`  
`no mac address-table vcs-sync-mode`

**Default** Disabled

**Mode** Global configuration

**Usage notes** MAC addresses are automatically learnt by stack members when a packet is seen by that stack member. Normally this is sufficient to make sure that all stack members that need the MAC address learn it.

If aggregators are used, it is possible for the path taken by packets travelling from host A to B to traverse different stack members than packets travelling from host B to A. In this case, the MAC addresses may not be learnt and traffic could be flooded. Even in this case, a broadcast packet from each unit, such as an ARP packet, would be enough to cause all stack members to learn these MAC addresses.

However, in very unusual cases, the automatic learning can still lead to some flooding. This command resolves such situations by synchronising MAC address entries between stack members. This will prevent the flooding that would otherwise occur in these unusual cases.

Note that enabling this feature has a small impact on CPU performance, because it slightly increases the numbers of packets sent to the CPU.

**Example** To make a MAC address learned by one stack member available to all members in the stack, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table vcs-sync-mode
```

**Related commands** [show mac address-table](#)

# reboot rolling

**Overview** This command reboots a stack in a rolling sequence to minimize downtime.

The stack master is rebooted, causing the remaining stack members to failover and elect a new master. The rebooted unit remains separate from the remaining stack and boots up as a stand-alone unit. Once the rebooted unit has finished running its configuration and has brought its ports up, it reboots all the remaining stack members at once.

**Syntax** `reboot rolling`

**Mode** Privileged Exec

**Usage notes** When stacking is used with EPSR, the EPSR **failovertime** must be set to at least 5 seconds to avoid any broadcast storms during failover. Broadcast storms may occur if the switch cannot failover quickly enough before the EPSR **failovertime** expires. For further information about EPSR **failovertime**, see the [epsr](#) command.

**Examples** To rolling reboot the stack, use the commands:

```
awplus# reboot rolling
```

```
Continue the rolling reboot of the stack? (y/n):
```

After running this command, the stack master will reboot immediately with the configuration file settings. The remaining stack members will then reboot once the master has finished re-configuring.

```
Continue the rolling reboot of the stack? (y/n):
```

```
awplus# y
```

**Related commands** [boot system](#)  
[epsr](#)

# reload rolling

**Overview** This command performs the same function as the [reboot rolling](#) command.

## remote-command (deleted)

**Overview** This command has been deleted in Software Version 5.4.4-1.1 and later. Instead, please use the [remote-login](#) command and then run the command you need to run remotely.

# remote-login

**Overview** This command is used only on the master in order to log onto the CLI of another stack member. In most respects the result of this is similar to being logged into the stack master. Configuration commands are still applied to all stack members, but show commands and commands that access the file system are executed locally.

The specific output obtained will vary greatly depending on the show command chosen.

**Syntax** `remote-login <stack-ID>`

Parameter	Description
<code>&lt;stack-ID&gt;</code>	Stack member number, from 1 to 4.

**Mode** Privileged Exec

**Usage notes** Note that some commands such as **ping** or **telnet** are not available when the remote-login is used.

**Example** To log onto stack member 2, use the following command:

```
awplus# remote-login 2
```

To return to the command prompt on the master stack member, type **exit**.

# show counter stack

**Overview** Use this command to display stack related counter information.

**Syntax** show counter stack

**Default** All counters are reset when the stack member is rebooted.

**Mode** User Exec and Privileged Exec

**Usage notes** This displays the stacking counter information for every stack member.

**Examples** To display the stacking counter information about the whole stack, use the following command:

```
awplus# show counter stack
```

Figure 57-2: Example output from the **show counter stack** command

```

**Table 1:** Parameters in the output of the **show counter stack** command

Parameters	Description
Topology Event Counters	
Units joined	Number of times that the stack acquires a member.
Units left	Number of times that the stack loses a member.
Links up	Number of times that a stack link is up in the stack.
Links down	Number of times that a stack link is down in the stack.

**Table 1:** Parameters in the output of the **show counter stack** command (cont.)

Parameters	Description
ID conflict	Number of times that stack-ID conflicts.
Master conflict	Number of times that stack master conflict occurs.
Master failover	Number of times that stack master fails.
Master elected	Number of times that stack master is elected.
Master discovered	Number of times that stack master is discovered.
SW autoupgrades	Number of times that the software in the stack members are auto upgraded.
<b>Stack port</b>	
Link up	Number of times that this unit's physical stack link has come up.
Link down	Number of times that this unit's physical stack link has come down.
Nbr re-init	Number of times that the neighbor is detected as having reinitialized.
Nbr incompatible	Number of times that the neighbor is detected as incompatible.
Nbr 2way comms	Number of times that the neighbor is in two way communication status.
Nbr full comms	Number of times that the neighbor is in full communication status.
<b>Topology message counters</b>	
Total	Total number of topology messages.
Hellos	Number of hello messages.
Topology DB	Number of topology database messages.
Topology update	Number of topology database update messages.
Link event	Number of link event messages.
Reinitialise	Number of reinitialize messages.
1-hop transport	Number of 1-hop transport messages.
Layer-2 transport	Number of layer 2 transport messages.

**Table 1:** Parameters in the output of the **show counter stack** command (cont.)

Parameters	Description
Link event	Number of link event messages.
Reinitialise	Number of reinitialize messages.
1-hop transport	Number of 1-hop transport messages.
Layer-2 transport	Number of Layer 2 transport messages.
Topology error counters	Reasons why a neighboring unit could not join the stack.
Version unsupported	Number of stack software version unsupported errors.
Product unsupported	Number of product unsupported errors.
XEM unsupported	Number of XEM unsupported errors.
Too many units	Number of too many units errors.
Invalid messages	Number of invalid messages.
Health status good	The number of times that the resiliency link has successfully carried healthchecks following a failure at startup.
Health status bad	The number of times that the resiliency link healthcheck has timed out. A timeout occurs when a backup stack member detects a delay greater than two seconds between healthcheck messages received.
Rx	The total number of healthcheck messages that a stack member has received from the stack master.
Rx Error	The total number of invalid healthcheck messages that have been received from the master. This message is not applicable to the stack master.

# show running-config stack

**Overview** Use this command to display the running system information specific to the stack.

```
show running-config stack
```

**Mode** Privileged Exec and Global Configuration

**Example** To display the stacking running configuration information, use the command:

```
awplus# show running-config stack
```

**Output** Figure 57-4: Example output from the **show running-config stack** command

```
awplus#show running-config stack

stack virtual-mac
stack virtual-chassis-id 1982
stack management vlan 4000
stack management subnet 192.168.254.0
stack resiliencylink eth0
stack enable
stack 2 priority 20
```

**Related commands** [show running-config](#)

# show provisioning (stack)

**Overview** Use this command to display the provisioning status of all installed or provisioned hardware. Provisioning is the preconfiguration necessary to accommodate future connection of hardware items such as a switch.

**Syntax** `show provisioning`

**Mode** User Exec and Privileged Exec

**Example** To show provisioning, use the following command:

```
awplus# show provisioning
```

**Output** Figure 57-5: Example output from **show provisioning**

```
Switch provisioning summary information
ID Board class Status
1.0 x930-28 Hardware present
2.0 x930-52 Provisioned
```

**Table 2:** Parameters in the output of the **show provisioning** command

Parameter	Description
ID	The unit bay-location of the hardware provision.
Board class	The hardware type.
Status	The provisioned state: <ul style="list-style-type: none"><li>• Hardware Present means that the hardware is currently installed in the stack.</li><li>• Provisioned means that although the hardware is not currently installed, the stack is preconfigured ready to accept the hardware installation.</li></ul>

**Related commands** [show stack](#)  
[switch provision \(stack\)](#)

# show stack

**Overview** Use this command to display summary information about current stack members.

**Syntax** show stack

**Mode** User Exec and Privileged Exec

**Usage notes** This command displays summary information about current stack members. See [show stack detail](#) to display detailed stack information.

**Example** To display summary information about the stack, use the command:

```
awplus# show stack
```

**Output** Figure 57-6: Example output from the **show stack** command

Virtual Chassis Stacking summary information						
ID	Pending ID	MAC address	Priority	Status	Role	
1	-	0000.cd28.07e1	128	Ready	Active Master	
2	-	0015.77c2.4d44	128	Ready	Backup Member

S/W version auto synchronization On
Resiliency link status Not configured
Stack port2.1.1 status Learnt neighbor 1
Stack port2.1.5 status Learnt neighbor 3
...

```

**Table 4:** Parameters in the output from the **show stack detail** command

Parameter	Description
S/W version auto synchronization	Whether the software-auto-synchronization feature is turned on or off.
Host name	The host name of the stack member.
ID	Stack-ID .
Last Role Change	The date and time the stack member last changed its role in the stack.
MAC address	Stack member MAC address.
Management VLAN ID	The VLAN ID currently used for stack management: the default is 4094.
Management VLAN subnet address	The current stacking management VLAN subnet address.
Virtual Chassis ID	The Virtual Chassis ID determines the last 12 bits of the Virtual MAC address: 0000.cd37.0xxx
Virtual MAC Address	The Virtual MAC address of the stack.
Disabled Master Monitoring	The current Disabled Master Monitoring status. This can be: <ul style="list-style-type: none"> <li>• <b>Enabled</b></li> <li>• <b>Disabled</b></li> <li>• <b>Inactive</b></li> </ul>

**Table 4:** Parameters in the output from the **show stack detail** command (cont.)

Parameter	Description
Operational Status	<p>The status of the stack. This can be:</p> <ul style="list-style-type: none"> <li>• <b>Normal operation:</b> If any other status is displayed, it may warrant further investigation.</li> <li>• <b>Stacking hardware disabled:</b> Use the <b>stack enable</b> command to activate the stacking feature.</li> <li>• <b>Operating in failover mode:</b> This stack member has become separated from the rest of the stack, or it failed to join the stack correctly.</li> <li>• <b>Standalone unit:</b> Stacking is enabled, but no other stack members are present.</li> <li>• <b>Not all stack ports are up:</b> One or more stacking ports may be down, or stacking discovery may not have detected the neighbor successfully.</li> </ul>
Stack Status	The stack's overall status. Note that a warning is issued if the stack is not connected in a standard ring topology.
Pending ID	The pending stack member ID. This can be changed by the . If there is no pending ID, the "-" symbol will display.
Stack port status	<p>The status of the stack port. This can be:</p> <ul style="list-style-type: none"> <li>• <b>Down</b></li> <li>• <b>Neighbor incompatible</b></li> <li>• <b>Discovering neighbor</b></li> <li>• <b>Learned neighbor</b></li> </ul>
Priority	Stack member master election priority (between 1 and 255) Note that the lowest number has the highest priority.
Product Type	The switch series that the stack member belongs to.
Provisioned	Indicates that the stack position is provisionally configured, i.e. ready to accept a particular switch type into the stack.

**Table 4:** Parameters in the output from the **show stack detail** command (cont.)

Parameter	Description
Resiliency link status	<p>The current status of the resiliency link. The status can be one of:</p> <ul style="list-style-type: none"> <li>• <b>Not configured</b> (Master or Member).</li> <li>• <b>Configured</b> (Master only).</li> <li>• <b>Successful:</b> Successfully receiving healthchecks from the Active Master.</li> <li>• <b>Failed</b> (Member only): Not receiving any healthchecks from the Active Master.</li> <li>• <b>Stopped:</b> The resiliency link is configured, but is inactive. This may occur in a Disabled Master stack, for example if the Disabled Master Monitoring feature is not used.</li> </ul>
Role	<p>Stack member's role in the stack, this can be one of:</p> <ul style="list-style-type: none"> <li>• <b>Active Master.</b></li> <li>• <b>Disabled Master</b>— The temporary master when there is a communication break within the stack, but communication still exists across the resiliency link. In this state all switch ports within the stack are disabled by default, but a different configuration can be run by a "" trigger command.</li> <li>• <b>Backup Member</b>— a device other than the stack master.</li> <li>• <b>Discovering</b>— joining the stack.</li> </ul>
Status	<p>Indicates how readily a stack member can take over as master if the current stack master were to fail.</p> <ul style="list-style-type: none"> <li>• <b>Init</b> — the stack member is completing the startup initialization.</li> <li>• <b>Syncing</b>— the stack member is synchronizing state information with the stack master following startup.</li> <li>• <b>Ready</b>— the stack member is fully synchronized with the current master and is ready to take over immediately.</li> </ul>

- [stack software-auto-synchronize](#)

# show stack indicator

**Overview** This command enables you to physically identify a specific stack member. This command will flash the Master Status LED for the stack member specified. The pattern will be a number of flashes in quick succession followed by a longer pause; where the number of flashes equals the stack member ID.

**Syntax** `show stack indicator [<stack-member>|all] [timeout <timeout-period>]`

Parameter	Description
<stack-member>	The ID of the stack member to be identified (1-8). Default is All.
all	Will flash the Master Status LED on each stack member with its own appropriate ID pattern.
<timeout-period>	The time period (in seconds) that the indication will display. Default is 30 seconds.

**Mode** User Exec and Privileged Exec

**Examples** To find stack member 2 by flashing its Master Status LED, use the command:

```
awplus# show stack indicator 2
```

To find stack member 2 by flashing its Master Status LED for 1 minute, use the command:

```
awplus# show stack indicator 2 timeout 60
```

# show stack resiliencylink

**Overview** Use this command to display information about the current status of the resiliency-link across the members of the stack.

**Syntax** `show stack resiliencylink`

**Mode** User Exec and Privileged Exec

**Example** To display information about the current status of the resiliency-link across the stack members, use the command:

```
awplus# show stack resiliencylink
```

**Output** Figure 57-8: Example output from the **show stack resiliencylink** command

```
awplus(config)# show stack resiliencylink
Stack member 1:

Status Configured
Interface vlan4093
Interface state UP
Resiliency-link port(s) port1.0.11

Stack member 2:

Status Successful
Interface vlan4093
Interface state UP
Resiliency-link port(s) port2.0.11
```

**Table 5:** Parameters in the output of the **show stack resiliencylink** command

Parameter	Description
Status	The current status of the stack member's resiliency link. Can be one of: <ul style="list-style-type: none"><li>• <b>Not configured</b> (Master or Member).</li><li>• <b>Configured</b> (Master only).</li><li>• <b>Successful:</b> Successfully receiving healthchecks from the Active Master.</li><li>• <b>Failed</b> (Member only): Not receiving any healthchecks from the Active Master.</li><li>• <b>Stopped:</b> The resiliency link is configured, but is inactive. This may occur in a Disabled Master stack, for example if the Disabled Master Monitoring feature is not used.</li></ul>
Interface	The name of the eth or VLAN interface that is connected to the resiliency link.
Interface state	The current status of the interface. Can be either up or down.
Resiliency-link port(s)	The switch port(s) the resiliency link is connected to.

**Related commands**

- [switch provision \(stack\)](#)
- [show stack](#)
- [stack resiliencylink](#)
- [switchport resiliencylink](#)

# stack disabled-master-monitoring

**Overview** This command enables the Disabled Master Monitoring (DMM) feature. If a stack member becomes a disabled master, the DMM feature will use the stack resiliency link to continue monitoring the health of the separated stack master.

Use the **no** variant of this command to disable the DMM feature.

**Syntax** `stack disabled-master-monitoring`  
`no stack disabled-master-monitoring`

**Default** By default, Disabled Master Monitoring is enabled. However, it only operates if there is a resiliency link.

**Mode** Global Configuration

**Usage** This command enables additional stack resiliency link functionality, which is used if a stack separation occurs. For DMM to operate, a resiliency link must also be configured (see the [stack resiliencylink](#) command). A stack separation could result in a stack member becoming a disabled master, which has the configuration as a normal stack master except that all its switchports are shutdown.

For more information about the disabled master state, see the [VCStack Feature Overview and Configuration Guide](#).

When the DMM feature is enabled, the disabled master will continue to monitor the health of the original stack master over the stack resiliency link connection. If the original stack master were to fail, when the DMM feature is enabled, then the disabled master will detect this and will automatically re-enable its switchports. This ensures that the stack will continue to pass network traffic, even if a catastrophic stack failure occurs.

For more information about the DMM feature when the stack member is a disabled master, see the [VCStack Feature Overview and Configuration Guide](#).

**Examples** To enable the DMM feature, use the following commands:

```
awplus# configure terminal
awplus(config)# stack disabled-master-monitoring
```

To disable the DMM feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no stack disabled-master-monitoring
```

**Related commands**

- [type stack disabled-master](#)
- [type stack master-fail](#)

# stack enable

**Overview** This command enables stacking on either the front-panel S1 & S2 ports or the ports of the AT-StackQS.

The **no** variant of this command removes a selected stack member switch, as specified by the *<stack-ID>* selection in the command syntax, from the virtual chassis stack. We recommend you uncable the stack member from the stack before issuing the **no** command.

**Syntax** `stack enable {builtin-ports|expansion-ports}`  
`no stack <stack-ID> enable`

Parameter	Description
<code>builtin-ports</code>	Enable stacking through the front-panel S1 & S2 ports
<code>expansion-ports</code>	Enable stacking through the ports of the AT-StackQS
<i>&lt;stack-ID&gt;</i>	Stack member number, from 1 to 8.

**Default** The default is **expansion-ports** if there is a AT-StackQS inserted, or **builtin-ports** otherwise.

**Mode** Global Configuration

**Example** To turn on stacking on the front-panel ports, use the command:

```
awplus# configure terminal
awplus(config)# stack enable builtin-ports
```

# stack management subnet

**Overview** This command configures the subnet address used by the stack management VLAN.

Use the **no** variant of this command to reset the stack's VLAN subnet management address back to the default address and mask (192.168.255.0/27).

**Syntax** `stack management subnet <ip-address>`  
`no stack management subnet`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The new subnet address for the stack management VLAN.

**Default** The default stacking management VLAN subnet address is 192.168.255.0 with a subnet mask 255.255.255.224 or /27.

**Mode** Global Configuration

**Usage notes** This command configures the stack management VLAN subnet address.

The management VLAN will be used for high speed communication between stacked units via the stacking ports. Although this command enables you to change the IP address command, the subnet mask must always remain as shown.

The stack management IP subnet is solely used internally to the stacked devices, and cannot be reached external to the stack. You should only change the stack management VLAN subnet address if it causes a conflict within your network.

Note that several separate stacks can use the same default management VLAN subnet address even though their user ports may share the same external network. If the stack subnet address is changed, then the configuration for any new units must also be updated before they are inserted into the stack.

If the management VLAN subnet address is changed by this command, you can use the **no** variant of this command to reset it to its default.

**Example** To set the management VLAN subnet address to 192.168.255.144:

```
awplus# configure terminal
awplus(config)# stack management subnet 192.168.255.144
```

**Related commands** [stack management vlan](#)

# stack management vlan

**Overview** Use this command to configure the stack management VLAN ID.

Use the **no** variant of this command to change the stack management VLAN ID back to the default (VLAN ID 4094).

**Syntax** `stack management vlan <2-4094>`  
`no stack management vlan`

Parameter	Description
<2-4094>	Stack management VLAN ID.

**Default** VLAN ID 4094

**Mode** Global Configuration

**Usage notes** The management VLAN is used for high speed communication between stacked units. This command enables you to change the ID of this VLAN.

The default stacking management VLAN ID is 4094, which is the last configurable VLAN ID in the switch.

The stack management VLAN is created and configured automatically so that the stack VLAN cannot be used in the stack's VLAN configuration commands. This means you cannot enter commands such as:

```
awplus(config-vlan)# vlan <stack-management-VLAN-ID>
```

You should only change the management VLAN if the VLAN ID 4094 needs to be used in the stack's VLAN configuration.

If necessary, you can use the **no** variant of this command to change the management VLAN back to its default value.

Changes to the stacking management VLAN configuration will take effect once the stack is restarted.

**Examples** To set the management VLAN to 4000, enter the following commands:

```
awplus# configure terminal
awplus(config)# stack management vlan 4000
```

To reset the management VLAN back to the default (4094), enter the following commands:

```
awplus# configure terminal
awplus(config)# no stack management vlan
```

**Related commands** [stack management subnet](#)

# stack priority

**Overview** When creating a stack, use this command to set the priority of the switch you want to be master for the stack.

**Syntax** `stack <stack-ID> priority <0-255>`  
`no stack <stack-ID> priority`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 4.
priority	The stack member's election priority value.
<0-255>	The stack member's new priority value. The lowest value is assigned the highest priority. The default is 128.

**Mode** Global Configuration

**Usage notes** This command is used to change the value of a specific stack member's master-election priority. If the specified stack-ID is not used by any current stack member, the command will be rejected.

The election criteria selects the stack member with the lowest priority value to become the stack master. Where two stack members both have the same lowest priority value, then the stack member with the lowest MAC address will be elected as master.

**NOTE:** Assigning a new priority value will not immediately change the current stack master. In order to force a master re-election after the new priority value is assigned, use `reboot stack-member <master's ID>` to reboot the current stack master, a new stack master will then be elected based on the new priority values.

**Example** To change the priority of stack member 2 to be 3, use the command:

```
awplus# configure terminal
awplus(config)# stack 2 priority 3
```

**Validation Command** `show stack`

# stack renumber

**Overview** Use this command to renumber a specific stack member.

**Syntax** `stack <existing stack-ID> renumber <new stack-ID>`

Parameter	Description
<code>&lt;existing stack-ID&gt;</code>	Enter the existing <code>stack-ID</code> in the range 1 to 8.
<code>renumber</code>	Change the existing <code>stack-ID</code> .
<code>&lt;new stack-ID&gt;</code>	Enter the new <code>stack-ID</code> in the range 1 to 8.

**Default** Every stack unit will initially try to use a `stack-ID` of 1.

**Mode** Global Configuration

**Usage notes** This command is used to change the ID of a specific stack member - primarily when exchanging stack members. The changes made by this command will not take effect until the switch is rebooted.

**NOTE:** *This command does not alter any of the stacks's existing configuration, apart from the `stack-ID` specified. For example, if stack member 2 were removed from the stack and a new stack unit is assigned the member 2 `stack-ID`, then the interface configuration that existed for the removed stack member 2 will be applied to the new stack member 2.*

The existing `stack-ID` must already be assigned to an existing stack member. To avoid duplicating IDs, a warning message will appear if you assign a new `stack-ID` that is currently assigned to another stack member. However, you can continue to renumber the `stack-IDs` and remove ID duplications. If you do not remove the duplications, then one of the devices will be forced to automatically renumber to an unused ID. Once you have removed any duplicate IDs, you can reboot the switch to implement your changes.

Note that the configured `stack-ID` is saved immediately on the renumbered member, and so is not reliant on using the `copy running-config` command for it to take effect.

**Example** To renumber stack 1 to stack 2, use the commands:

```
awplus# configure terminal
awplus(config)# stack 1 renumber 2
```

**Validation Command** `show stack`

# stack renumber cascade

**Overview** This command is used to renumber the members of a stack so that their IDs are ordered sequentially, relative to the member's physical position within the stack.

**CAUTION:** *Changing the stack numbering will upset the existing stack member configurations such as port settings. This command is intended for use when the stack is either initially commissioned, or has undergone a major reconfiguration. In this situation you run the stack renumber command (which will automatically reboot the switch), then configure the stack members to meet the new requirements.*

**Syntax** `stack <stack-ID> renumber cascade [<new-stack-ID>]`

Parameter	Description
<stack-ID>	The ID of the stack member to start renumbering from, from 1 to 4.
renumber	Change the existing stack-ID.
cascade	Renumber the existing stack-ID in cascade order.
<new-stack-ID>	The new ID for the first member renumbered, from 1 to 4.

**Default** If no new-stack-ID is specified, the member will take the default ID of 1.

**Mode** Global Configuration

**Usage notes** This command is used to renumber the members of a stack so that their stack-IDs are ordered sequentially. This would normally be done either when the stack is initially configured or following a major reconfiguration.

The renumber will start on the specified stack member. If that stack-ID is not used by any of the existing stack members, the command will be rejected.

The starting stack member will be renumbered with the new stack-ID specified, or the default of member ID of 1. The stack-ID of the next physically will be the starting member's ID +1, for example member ID 2. This renumbering will continue in cascading order around the stack members.

The changes will take place immediately and reboot all stack members. For this reason a confirmation prompt follows this command entry, asking whether you are sure you want to renumber and reboot the entire stack.

**Example** `awplus(config)# stack 1 renumber cascade`

```
Any existing interface configuration
may no longer be valid.
```

```
Are you sure you want to renumber and reboot the entire
stack?(y/n): y
```

**Related  
commands** [show stack](#)  
[switch provision \(stack\)](#)  
[stack renumber](#)

# stack resiliencylink

**Overview** This command configures the resiliency link used by the stack.

The interface used is a dedicated VLAN (resiliencylink VLAN) to which switch ports may become members. This VLAN is dedicated to the resiliency link function and must not be the stack management VLAN.

Alternatively, the interface may be a NET MGMT port (eth0).

**Syntax** `stack resiliencylink <interface>`  
`no stack resiliencylink`

Parameters	Description
<code>&lt;interface&gt;</code>	The name of the interface that is connected to the resiliency link. This may be either the eth port or the resiliencylink VLAN.

**Mode** Global Configuration

**Usage notes** The resiliency-link is only used when a backup member loses connectivity with the master via the stacking cables. Such a communication loss would occur if:

- a stacking link is removed or fails
- two or more stacking link cables are unplugged or fail
- the stack master itself fails due to a reboot or power failure

The resiliency-link allows the backup member to determine if the master is still present in the network by the reception of healthcheck messages sent by the master over the resiliency-link interface.

Reply healthcheck messages are received if the master is still online, but the stack will now split into two different “stubs”. The stub containing the existing master will continue operating as normal. The members in the masterless stub will now use a “type stack disabled-master” trigger to run a configuration to form a second temporary stack. This utilizes the remaining stack members' resources without conflicting directly with the master's configuration. If no “type stack disabled-master” trigger was configured on the switches, then the masterless stub members will disable their switch ports.

If no healthcheck messages are received, then the master is assumed to be completely offline, and so the other stack members can safely take over the master's configuration.

**CAUTION:** *The purpose of the resiliency link is to enable the stack members (particularly the backup master) to check the status of the master under fault conditions. If the resiliency link is not configured, and the master loses communication with its other stack members, then the stack will assume the master is NOT present in the network, which could cause network conflicts if the master is still online. Note that this is a change to the behavior of stacking in releases prior to version 5.3.1.*

**Example** To set the resiliency link to be eth0, use the following commands:

```
awplus# configure terminal
awplus(config)# stack resiliencylink eth0
```

To set the resiliency link to be VLAN 4093, first create VLAN 4093 as the resiliencylink VLAN. You do not have to use **vlan database** to create the VLAN, because the **stack resiliencylink** command creates it:

```
awplus# configure terminal
awplus(config)# stack resiliencylink vlan4093
```

Next assign VLAN 4093 to the interface port, in this case port1.0.1:

```
awplus(config)# interface port1.0.1
awplus(config-if)# switchport resiliencylink
```

**Related  
commands**

[show stack](#)  
[switch provision \(stack\)](#)

[stack disabled-master-monitoring](#)  
[switchport resiliencylink](#)

# stack software-auto-synchronize

**Overview** This command re-enables the software version auto-synchronization feature either on a specified stack member or all stack members.

Use the **no** variant of this command to turn the software version auto-synchronization feature off.

**Syntax** `stack {all|<stack-ID>} software-auto-synchronize`  
`no stack {all|<stack-ID>} software-auto-synchronize`

Parameter	Description
all	All stack members.
<stack-ID>	Stack member number, from 1 to 4.

**Default** Enabled on all stack members

**Mode** Global Configuration

**Usage notes** This command is used to enable the software version auto-synchronization feature for either a specific stack member or all stack members and candidates.

Note that if a device attempts to join a stack but is running a software release that is different to the other stack members, the software version auto-synchronization feature will copy the master's software release onto the new member. If the software version auto-synchronization feature is not enabled, then the device will be unable to join the stack.

Note that the software version auto-synchronization feature may also result in the stack member downgrading its software release if the master is running an older software version.

**Examples** To turn on the software-auto-synchronize feature on stack member 2, which was previously turned off, use the following commands:

```
awplus# configure terminal
awplus(config)# stack 2 software-auto-synchronize
```

To turn on the software-auto-synchronize feature for all stack members, which were previously turned off, use the following commands:

```
awplus# configure terminal
awplus(config)# stack all software-auto-synchronize
```

**Related commands** [show stack](#)

# stack virtual-chassis-id

**Overview** This command specifies the stack virtual chassis ID. The ID selected will determine which virtual MAC address the stack will use. The MAC address assigned to a stack must be unique within its network.

**NOTE:** *The command will not take effect until the switch has been rebooted.*

**Syntax** `stack virtual-chassis-id <id>`

Parameter	Description
<code>&lt;id&gt;</code>	The value of the ID - enter a decimal number in the range 0 to 4095.

**Mode** Global Configuration

**Usage notes** The virtual-chassis-id entered will form the last 12 bits of a pre-selected MAC prefix component; that is, 0000.cd37.0xxx. If you enable the stack virtual MAC address feature (by using the [stack virtual-mac](#) command) without using the `stack virtual-chassis-id` command to select the virtual-chassis-id, then the stack will select a virtual-chassis-id from a number within the assigned range.

**Example** To set the stack virtual-chassis-id to 63 use the commands

```
awplus# configure terminal
awplus(config)# stack virtual-chassis-id 63
```

This will result in a virtual MAC address of 0000.cd37.003f.

**Related commands**

- [show running-config](#)
- [show stack](#)
- [switch provision \(stack\)](#)
- [stack virtual-mac](#)

# stack virtual-mac

**Overview** This command enables the stack virtual MAC address feature. For more information on this topic, see the [VCStack Feature Overview and Configuration Guide](#). With this command set, the value used as the virtual MAC address is determined by the setting of the command [stack virtual-chassis-id](#).

You must enable **stack virtual-mac**, in order to minimize data loss if a new stack member is required to become the VCStack master.

Before enabling the virtual MAC address feature, you should check that the stack's virtual-chassis-id is not already used by another stack in the network. Otherwise the duplicate MAC addresses will cause problems for the network traffic.

**Syntax** `stack virtual-mac`  
`no stack virtual-mac`

**Default** The stack virtual MAC address feature is disabled by default. However, if you manually turn on stacking (by entering the **stack enable** command), then that enables the stack virtual MAC address feature as well.

**Mode** Global Configuration

**Usage notes** Note that this command will not take effect until the switch has been rebooted.

**Example**

```
awplus# configure terminal
awplus(config)# stack virtual-mac
```

**Related commands** [show running-config](#)  
[show stack](#)  
[switch provision \(stack\)](#)  
[stack virtual-chassis-id](#)

# switch provision (stack)

**Overview** This command enables you to provide the configuration for a new stack member switch prior to physically connecting it to the stack. To run this command, the stack position must be vacant. The selected hardware type must be compatible with existing stack hardware.

Use the **no** variant of this command to remove an existing switch provision.

**Syntax** `switch <stack-ID> provision {x930-28|x930-52}`  
`no switch <stack-ID> provision`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 4.
provision	Provides settings within the stack configuration ready for a specific switch type to become a stack member.
x930-28	Provision a 28-port x930 switch.
x930-52	Provision a 52-port x930 switch.

**Mode** Global Configuration

**Examples** To provision an x930-28GTX switch as stack member 3, use the following commands:

```
awplus# configure terminal
awplus(config)# switch 3 provision x930-28
```

To remove the provision of the x930-28GTX switch as stack member 3, use the following commands:

```
awplus# configure terminal
awplus(config)# no switch 3 provision
```

**Related commands** [show provisioning \(stack\)](#)  
[show stack](#)

**Command changes** Version 5.4.8-1.1: SBx908 GEN2 syntax changed

# switchport resiliencylink

**Overview** This command configures the switch port to be a member of the stack resiliency link VLAN. Note that this switchport will only be used for stack resiliency-link traffic and will not perform any other function, or carry any other traffic.

The **no** variant of this command removes the switchport from the resiliency link VLAN.

**Syntax** `switchport resiliencylink`  
`no switchport resiliencylink`

**Mode** Interface Configuration

**Usage notes** Note that a resiliency link cannot be part of a static or dynamic aggregator group.

**Examples** To set the resiliency link to be VLAN 4093:

First, use the **stack resiliencylink** command to create the resiliency-link vlan `vlan4093`

```
awplus# configure terminal
awplus(config)# stack resiliencylink vlan4093
```

Next, use the **switchport resiliencylink** command to assign the resiliency-link vlan to the port, in this case `port1.0.1`.

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport resiliencylink
```

**Related commands** [stack resiliencylink](#)  
[show stack resiliencylink](#)

## vlan mode stack-local-vlan

**Overview** This command enables you to create stack-local-VLANs and use ICMP to monitor and diagnose issues within specific members of the stack. When a VLAN is added using this method, all its traffic will be trapped to and processed by the CPU of the specific local stack member, rather than the CPU of the stack master.

The **no** variant of this command destroys the specified VLAN.

**Syntax** `vlan <vid> mode stack-local-vlan <member-id>`  
`no vlan <vid>`

Parameter	Description
<code>&lt;vid&gt;</code>	The VID of the VLAN to be created in the range 2-4094. We recommend that the first stack-local-vlan be assigned the number 4001 for the first stack member, then incremented by one for each stack member. For example, a stack of four members would be assigned the following VID numbers: <ul style="list-style-type: none"><li>• stack member one: VID 4001</li><li>• stack member two: VID 4002</li><li>• stack member three: VID 4003</li><li>• stack member four: VID 4004</li></ul>
<code>mode stack-local-vlan</code>	Specifies that the new VLAN will function as a stack-local-VLAN.
<code>&lt;member-id&gt;</code>	Specifies the stack member ID. Enter a decimal number in the range 1-4.

**Default** By default, VLANs are automatically enabled as they are added.

**Mode** VLAN Configuration

**Usage notes** If IGMP snooping is operating on a stack-local-VLAN, the device will try to process some multicast traffic via that VLAN, if it is connected to a Microsoft Windows PC. To avoid this, we recommend disabling IGMP snooping on stack-local-VLANs, by using the command **no ip igmp snooping**.

**Examples** To add a stack-local-VLAN with the VID of 4002 and assign it to stack member 2, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 4002 mode stack-local-vlan 2
awplus(config-vlan)# exit
awplus(config)# interface vlan4002
awplus(config-if)# no ip igmp snooping
```

To remove VLAN 4002, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 4002
```

# advertisement-interval

**Overview** Use this command to configure the advertisement interval of the virtual router. This is the length of time, in seconds, between each advertisement sent from the master to its backup(s).

IPv6 VRRP advertisements are sent to the multicast address assigned to the VRRP group (ff02:0:0:0:0) and a backup virtual router has to join all multicast groups within this range. VRRP advertisements are sent to a multicast address (ff02::12) every second by default.

Use the **no** variant of this command to remove an advertisement interval of the virtual router, which has been set using the **advertisement-interval** command, and revert to the default advertisement interval of 1 second.

**Syntax** advertisement-interval [`<1-255>`|csec `<1-4095>`]  
no advertisement-interval

Parameter	Description
<code>&lt;1-255&gt;</code>	Specifies the advertisement interval in seconds.
csec	Use centiseconds instead of seconds for the advertisement interval.
<code>&lt;1-4095&gt;</code>	Specifies the advertisement interval in centiseconds.

**Default** The default advertisement interval is 1 second.

**Mode** Router Configuration

**Usage notes** Note when using VRRP with VCStacking, ensure the VRRP advertisement-interval is larger than the VCStacking failover time to avoid VCStacking failovers causing VRRP failovers.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about:

- setting the advertisement-interval when configuring VRRP
- using seconds for VRRPv2 host compatibility whenever you use [transition-mode](#) to upgrade or transition from VRRPv2 to VRRPv3
- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details

**NOTE:** When using VRRPv3 with VCStacking, ensure that the VRRPv3 advertisement-interval is configured to a longer time than the VCStacking failover time.

If the VRRPv3 advertisement-interval is shorter than the VCStacking failover time, then a VRRPv3 failover will also occur whenever a VCStacking failover occurs. Use seconds not centiseconds to ensure interoperability with VRRPv2.

**Examples** The example below shows you how to configure the advertisement interval to 6 seconds for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

The example below shows you how to reset the advertisement interval to the default of 1 second for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no advertisement-interval
```

The example below shows you how to configure the advertisement interval to 6 seconds for the VRRPv3 IPv6 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

**Related commands** [router vrrp \(interface\)](#)  
[router ipv6 vrrp \(interface\)](#)

# alternate-checksum-mode

**Overview** Use this command to enable an alternate checksum mode for VRRPv3 to allow inter-operability with some other vendors' products. The IPv4 checksum for VRRPv3 advertisements will then use a pseudo header in the calculation.

This mode may be required if the other product indicates checksum errors on VRRP packets sent by AlliedWare Plus devices.

Use the **no** variant of this command to disable the alternate checksum mode.

**Syntax** `alternate-checksum-mode`  
`no alternate-checksum-mode`

**Default** Disabled

**Mode** Router Configuration

**Example** To turn on the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# alternate-checksum-mode
```

To turn off the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# no alternate-checksum-mode
```

**Related commands** [show running-config](#)

**Command changes** Version 5.4.7-1.1: command added

# circuit-failover

**Overview** Use this command to enable the VRRP circuit failover feature.

Circuit failover enables the device to take action if the uplink interface goes down, so that the VRRP backup, whose uplink interface is still active, takes over as VRRP master. See the Usage section below and the [VRRP Feature Overview and Configuration Guide](#) for more information.

Use the **no** variant of this command to disable this feature.

**Syntax** `circuit-failover <interface> <1-253>`  
`no circuit-failover [<interface> <1-253>]`

Parameter	Description
<code>&lt;interface&gt;</code>	The interface of the router that is monitored. The interface must exist on the router, and is usually an upstream interface. Should the interface go down, then another router that is configured as a backup router in the group takes over as the master. You should configure the circuit failover on an interface other than the active VRRP interface - generally the uplink interface.
<code>&lt;1-253&gt;</code>	Delta value. The value by which virtual routers decrement their priority value during a circuit failover event. Configure this value to be greater than the difference of priorities on the master and backup routers. In the case of failover, this priority delta value is subtracted from the current VR Master Router priority value.

**Mode** Router Configuration

**Usage notes** You can use Circuit Failover to monitor up to 32 interfaces per VRRP instance. If a VRRP instance is configured to monitor multiple interfaces, the VRRP priority will be cumulatively decremented by the configured delta for each interface as it goes down.

For example, if VRRP is configured to monitor VLAN2 and VLAN3 with the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip address 192.168.1.1/24
awplus(config-if)# exit
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# virtual-ip 192.168.1.10 backup
awplus(config-router)# priority 100
awplus(config-router)# circuit-failover vlan2 10
awplus(config-router)# circuit-failover vlan3 20
```

then the following examples explain the effect of each VLAN going down:

- If only VLAN2 fails, then the VRRP priority will be decremented by 10. VRRP priority would be adjusted to become 90, because  $100 - 10 = 90$ .
- If only VLAN3 fails, then the VRRP priority will be decremented by 20. VRRP priority would be adjusted to become 80, because  $100 - 20 = 80$ .
- If both VLAN2 and VLAN3 fail, then the VRRP priority will be decremented by the cumulative delta values of all monitored interfaces. VRRP priority would therefore be adjusted to become 70, because  $100 - 10 - 20 = 70$ .

As each monitored interface recovers, the VRRP priority is incremented by the same delta value.

When you configure the delta values of the monitored interfaces, make sure their sum is high enough to ensure that the VRRP priority stays above zero if all the interfaces go down.

**Examples** To configure circuit failover on an IPv4 VRRP instance, so that if interface VLAN3 goes down, then the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRP IPv4 session with VR ID 1 on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

To configure circuit failover on a VRRPv3 IPv6 session with VR ID 1, so that when interface VLAN3 goes down, the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRPv3 IPv6 session with VR ID 1 on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

**Related commands** [router vrrp \(interface\)](#)  
[router ipv6 vrrp \(interface\)](#)

# debug vrrp

**Overview** Use this command to specify debugging options for VRRP. The **all** parameter turns on all the debugging options.

Use the **no** variant of this command to disable this function.

**Syntax** `debug vrrp [all]`  
`no debug vrrp [all]`

**Mode** Privileged Exec and Global Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp all
```

The example below shows you how to disable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp all
```

**Related commands** [show debugging vrrp](#)  
[undebug vrrp](#)

# debug vrrp events

**Overview** Use this command to specify debugging options for VRRP event troubleshooting. Use the **no** variant of this command to disable this function.

**Syntax** `debug vrrp events`  
`no debug vrrp events`

**Mode** Privileged Exec and Global Configuration

**Usage notes** The **debug vrrp events** command enables the display of debug information related to VRRP internal events.  
See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp events
```

The example below shows you how to disable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp events
```

**Related commands** [show debugging vrrp](#)  
[undebug vrrp events](#)

# debug vrrp packet

**Overview** Use this command to specify debugging options for VRRP packets.  
Use the **no** variant of this command to disable this function.

**Syntax** debug vrrp packet [send|recv]  
no debug vrrp packet [send|recv]

Parameter	Description
send	Specifies the debug option set for sent packets.
recv	Specifies the debug option set for received packets.

**Mode** Privileged Exec and Global Configuration

**Usage notes** The **debug vrrp packet** command enables the display of debug information related to the sending and receiving of packets.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable received and sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet
```

The example below shows you how to enable only received packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet recv
```

The example below shows you how to enable only sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet send
```

The example below shows you how to disable packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp packet
```

**Related commands** [show debugging vrrp](#)  
[undebug vrrp packet](#)

# disable (VRRP)

**Overview** Use this command to disable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router to stop it participating in virtual routing. Note that when this command is configured then a backup router assumes the role of master router depending on its priority. See the [enable \(VRRP\)](#) command to enable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router.

**Syntax** `disable`

**Mode** Router Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** The example below shows you how to disable the VRRP session for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# disable
```

The example below shows you how to disable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# disable
```

**Related commands**

- [enable \(VRRP\)](#)
- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)
- [show vrrp](#)

# enable (VRRP)

**Overview** Use this command to enable the VRRP session on the router to make it participate in virtual routing. To make changes to the VRRP configuration, first disable the router from participating in virtual routing using the [disable \(VRRP\)](#) command.

**Syntax** enable

**Mode** Router Configuration

**Usage notes** You must configure the virtual IP address and define the interface for the VRRP session (using the [virtual-ip](#) or [virtual-ipv6](#) and the [router vrrp \(interface\)](#) or [router ipv6 vrrp \(interface\)](#) commands) before using this command.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** To enable the VRRP session for VRRP VR ID 5 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# enable
```

To enable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# enable
```

**Related commands**

- [disable \(VRRP\)](#)
- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)
- [show vrrp](#)
- [virtual-ip](#)
- [virtual-ipv6](#)

# preempt-mode

**Overview** Use this command to configure preempt mode. If preempt-mode is set to **true**, then the highest priority backup will always be the master when the default master is unavailable.

If preempt-mode is set to **false**, then a higher priority backup will not preempt a lower priority backup who is acting as master.

If preempt-mode is set to **true**, an extra parameter is available called **delay-time**. If the delay-time parameter is used, a VRRP router with a higher priority will wait the configured length of time before it preempts the lower priority VRRP router to take over as master.

**Syntax** `preempt-mode {true|false}[delay-time <0-3600>]`

Parameter	Description
true	Preemption is enabled.
false	Preemption is disabled.
delay-time	Enable preempting but delay the preempt by the amount of seconds specified by the delay-time value. Note, a delay-time of 0 means delayed preempting is disabled.

**Default** The default is **true**.

**Mode** Router Configuration

**Usage notes** When the master router fails, the backup routers come online in priority order—highest to lowest. Preempt mode means that a higher priority back up router will take over the master role from a lower priority back up. Preempt mode set to **true** allows a higher priority backup router to relieve a lower priority backup router.

By default, a preemptive scheme is enabled whereby a higher priority backup virtual router that becomes available takes over from the backup virtual router that was previously elected to become the master virtual router.

This preemptive scheme can be disabled using the **preempt-mode false** command. If preemption is disabled on a backup virtual router that is starting up, and this router has a higher priority than the current master, the higher priority backup will not preempt the current master, and the lower priority master will stay in the master role.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- preempt mode and preempt delay-time

**Examples** The example below shows you how to configure preempt-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure preempt-mode as true for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure delay-time as 20 seconds for VRRPv3 VR ID 5 on vlan5:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan5
awplus(config-router)# preempt-mode true delay-time 20
```

**Related commands**

- [circuit-failover](#)
- [priority](#)
- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)

# priority

**Overview** Use this command to configure the VRRP router priority within the virtual router. The highest priority router is Master (unless `preempt-mode` is false).

Use the **no** variant of this command to remove the VRRP router priority within the virtual router, which has been set using the **priority** command.

**Syntax** `priority <1-255>`  
`no priority`

Parameter	Description
<code>&lt;1-255&gt;</code>	The priority. For the master router, use 255 for this parameter; otherwise use any number from the range <code>&lt;1-254&gt;</code> .

**Default** Defaults for priority are: **master router**= 255; **backup**= 100.

**Mode** Router Configuration

**Usage notes** Priority determines the role that each VRRP router plays and what happens if the master virtual router fails. If a VRRP router owns the IP address of the virtual router and the IP address of the interface, then this VRRP router functions as the master virtual router.

Priority also determines whether a VRRP router functions as a backup virtual router and the order of ascendancy to becoming a master virtual router if the master virtual router fails. Configure the priority of each backup virtual router with a value of 1 through 254.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** The example below shows you how to configure 101 as the priority for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# priority 101
```

The example below shows you how to remove the priority configured for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no priority
```

The example below shows you how to configure 101 as the priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# priority 101
```

The example below shows you how to remove the configured priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no priority
```

**Related commands** [circuit-failover](#)  
[preempt-mode](#)

# router ipv6 vrrp (interface)

**Overview** Use this command to configure VRRPv3 for IPv6 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRPv3 for IPv6 configuration. Disable the VRRP session before using the **no** variant of this command.

**Syntax** `router ipv6 vrrp <vrid> <interface>`  
`no router ipv6 vrrp <vrid> <interface>`

Parameter	Description
<vrid>	<1-255> The ID of the virtual router VRRPv3 IPv6 session to create.
<interface>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages.

**Mode** Global Configuration

**Usage notes** Use the required <interface> placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

**NOTE:** *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Examples** The example below shows you how to enable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan2
awplus(config-router)# enable
awplus(config-router)#
```

The example below shows you how to disable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router ipv6 vrrp 3 vlan2
awplus(config)#
```

**Related  
commands** advertisement-interval  
circuit-failover

# router vrrp (interface)

**Overview** Use this command to configure VRRP IPv4 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRP IPv4 configuration. Disable the VRRP session before using the **no** variant of this command.

**Syntax** `router vrrp <vrid> <interface>`  
`no router vrrp <vrid> <interface>`

Parameter	Description
<code>&lt;vrid&gt;</code>	<code>&lt;1-255&gt;</code> The ID of the virtual router VRRP IPv4 session to create.
<code>&lt;interface&gt;</code>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRP IPv4 advertisement messages.

**Mode** Global Configuration

**Usage notes** Use the required `<interface>` placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

**NOTE:** *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Examples** To enable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan1
awplus(config-router)# enable
```

To disable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router vrrp 5 vlan1
```

**Related  
commands**

- advertisement-interval
- circuit-failover
- disable (VRRP)
- enable (VRRP)

# show debugging vrrp

**Overview** Use this command to display the set VRRP debugging option. Use the terminal monitor command to display output on the console otherwise debug output is in the log file.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Syntax** `show debugging vrrp`

**Mode** User Exec and Privileged Exec

**Example** The example below shows you how to display VRRP debugging:

```
awplus# show debugging vrrp
```

**Related commands**

- `debug vrrp`
- `debug vrrp events`
- `debug vrrp packet`

# show running-config router ipv6 vrrp

**Overview** Use this command to show the running configuration for VRRPv3 IPv6.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Syntax** `show running-config router vrrp`

**Mode** Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

**Example** The example below shows you how to display the running configuration for VRRPv3 IPv6:

```
awplus# show running-config router ipv6 vrrp
```

**Output** Figure 58-1: Example output from the **show running-config router ipv6 vrrp** command

```
!
router ipv6 vrrp 3 vlan3
 virtual-ip fe80::202:b3ff:fed5:983e master
 circuit-failover vlan3 3
 advertisement-interval 6
 preempt-mode false
!
```

# show running-config router vrrp

**Overview** Use this command to show the running configuration for VRRP IPv4.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show running-config router vrrp`

**Mode** Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

**Example** The example below shows you how to display the running configuration for VRRP IPv4:

```
awplus# show running-config router vrrp
```

**Output** Figure 58-2: Example output from the **show running-config router vrrp** command

```
!
router vrrp 2 vlan2
 circuit-failover vlan2 2
 advertisement-interval 4
 preempt-mode true
!
```

# show vrrp

**Overview** Use this command to display information about all VRRP IPv4 sessions. This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show vrrp [brief]`

Parameter	Description
brief	Brief summary of VRRP sessions.

**Mode** User Exec and Privileged Exec

**Example** To display information about all VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp
```

To display brief summary output about VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp brief
```

**Output** Figure 58-3: Example output from the **show vrrp** command

```
awplus#show vrrp
VMAC enabled
Address family IPv4
VRRP Id: 1 on interface: vlan2
State: AdminUp - Master
Virtual IP address: 192.168.1.2 (Not-owner)
Priority is 100
Advertisement interval: 100 centiseconds
Preempt mode: TRUE
Multicast membership on IPv4 interface vlan2: JOINED
Transition mode: FALSE
Accept mode: FALSE
Master address: 192.168.1.3
```

Figure 58-4: Example output from the **show vrrp brief** command

```
awplus#show vrrp brief
Interface Grp Prio Own Pre State Master addr Group addr
vlan10 1 200 N P Master 192.168.10.4 192.168.10.253
vlan10 2 150 N P Backup 192.168.10.4 192.168.10.254
vlan11 3 200 N P Master 192.168.11.4 192.168.11.253
vlan11 4 150 N P Backup 192.168.11.4 192.168.11.254
```

**Related  
commands**    enable (VRRP)  
                  disable (VRRP)

# show vrrp counters

**Overview** This command displays VRRP SNMP counters on the console, as described in the VRRP MIB and RFC2787, for debugging use while you configure VRRP with commands in this chapter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show vrrp counters`

**Mode** User Exec and Privileged Exec

**Usage notes** The output has a section for global counters and a section of counters for each VRRP instance configured. See the descriptions of the counters below the sample output as per RFC2787.

**NOTE:** Note that the counters displayed with this commands are the same counters as described in RFC 2787 (Copyright (C) The Internet Society (2000). All Rights Reserved) except for the “Monitored Circuit Up” and “Monitored Circuit Down” counters, which are additions beyond the MIB.

**Example** To display information about VRRP SNMP counters on the console, enter the command:

```
awplus# show vrrp counters
```

Figure 58-5: Example output from the **show vrrp counters** command

```
awplus#show vrrp counters
VRRP Global Counters:
 Checksum Errors 230
 Version Errors 0
 VRID Errors 230

VRRP IPv4 counters for VR 10/vlan10:
 Master Transitions 0
 Received Advertisements ... 0
 Internal Errors 0
 TTL Errors 0
 Received Priority 0 Pkt ... 0
 Sent Priority 0 Pkt 0
 Received Invalid Type 0
 Address List Errors 0
 Packet Length Errors 0
 Monitored Circuit Up 0
 Monitored Circuit Down..... 0
```

```
VRRP IPv4 counters for VR 100/vlan100:
Master Transitions 1
Received Advertisements ... 1614
Internal Errors 0
TTL Errors 0
Received Priority 0 Pkt ... 0
Sent Priority 0 Pkt 0
Received Invalid Type 0
Address List Errors 0
Packet Length Errors 0
Monitored Circuit Up 0
Monitored Circuit Down.... 2
```

**Table 1:** Global counters with descriptions for the **show vrrp counters** command:

Counter	Description
Checksum Errors	The total number of VRRP packets received with an invalid VRRP checksum value.
Version Errors	The total number of VRRP packets received with an unknown or unsupported version number.
VRID Errors	The total number of VRRP packets received with an invalid VRID for this virtual router.

**Table 2:** Per VR counters with descriptions for the **show vrrp counters** command:

Counter	Description
Master Transitions	The total number of times that this virtual router's state has transitioned to MASTER.
Received Advertisements	The total number of VRRP advertisements received by this virtual router.
Internal Errors	The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router.
TTL Errors	The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.
Received Priority 0 Pkt	The total number of VRRP packets received by the virtual router with a priority of '0'.
Sent Priority 0 Pkt	The total number of VRRP packets sent by the virtual router with a priority of '0'.
Received Invalid Type	The number of VRRP packets received by the virtual router with an invalid value in the 'type' field.
Address List Errors	The total number of packets received for which the address list does not match the locally configured list for the virtual router.

**Table 2:** Per VR counters with descriptions for the **show vrrp counters** command: (cont.)

Counter	Description
Packet Length Errors	The total number of packets received with a packet length less than the length of the VRRP header.
Monitored Circuit Up	The total number of times the monitored circuit has generated the UP event.
Monitored Circuit Down	The total number of times the monitored circuit has generated the down event.

# show vrrp ipv6

**Overview** Use this command to display information about all configured VRRPv3 IPv6 sessions for all interfaces, or all VRRPv3 IPv6 sessions for a given interface with the optional parameter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Syntax** `show vrrp ipv6 [<interface>]`

Parameter	Description
<code>&lt;interface&gt;</code>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages.

**Mode** User Exec and Privileged Exec

**Example** To display information about all VRRPv3 IPv6 sessions, enter the command:

```
awplus# show vrrp ipv6
```

**Output** Figure 58-6: Example output from the **show vrrp ipv6 vlan2** command

```
awplus#show vrrp ipv6 vlan2
VrId <1>
 State is Master
 Virtual IP is fe80::202:b3ff:fed5:983e (Owner)
 Interface is vlan2
 Priority is 255
 Advertisement interval is 4 sec
 Preempt mode is FALSE
```

**Related commands** [enable \(VRRP\)](#)  
[disable \(VRRP\)](#)

# show vrrp (session)

**Overview** Use this command to display information for a particular VRRP session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show vrrp <vrid> <interface>`

Parameter	Description
<code>&lt;vrid&gt;</code>	<code>&lt;1-255&gt;</code> The virtual router ID for which to display information. Session must already exist.
<code>&lt;interface&gt;</code>	The interface to display information about, for instance, <code>vlan2</code> .

**Mode** User Exec and Privileged Exec

**Usage notes** See the below sample output from the **show vrrp** command displaying information about VRRP session 1 configured on **vlan2**. Output shows that a Virtual IP address has been set.

```
awplus# show vrrp 1 vlan2
```

```
awplus#show vrrp 1 vlan2
Address family IPv4
VrId <1>
 Interface is vlan2
 State is Initialize
 Virtual IP address is 10.10.11.250 (Not IP owner)
 Priority is 100
 Advertisement interval is 1 sec
```

See the below sample output from the **show vrrp** command displaying information about VRRP session 1 configured on **vlan3**. Output shows a Virtual IP address has not been set.

```
awplus# show vrrp 1 vlan3
```

```
awplus#show vrrp 1 vlan3
Address family IPv4
VrId <1>
 Interface is vlan3
 State is Initialize
 Virtual IP address is unset
 Priority is 100
 Advertisement interval is 1 sec
 Preempt mode is TRUE
```

**Example** The following command shows information about VRRP session 5 for interface **vlan2**.

```
awplus# show vrrp 5 vlan2
```

# transition-mode

**Overview** Use this command to configure the IPv4 transition mode. Transition mode allows you to upgrade from VRRPv2 to VRRPv3 and gives interoperability between VRRPv2 and VRRPv3.

If transition-mode is set to **true**, then the IPv4 transition mode is enabled and VRRPv2 and VRRPv3 advertisements are sent allowing VRRPv2 and VRRPv3 interoperability. Received VRRPv2 advertisement packets are accepted and processed when transition-mode is true.

If transition-mode is set to **false**, then the IPv4 transition mode is disabled and only VRRPv3 advertisements are sent. Received VRRPv2 advertisement packets are dropped.

Note the [advertisement-interval](#) should not be configured to less than 1 second when using transition-mode. VRRPv2 can only use advertisements in whole second intervals.

**Syntax** `transition-mode {true|false}`

Parameter	Description
true	Transition mode is enabled. This results in VRRPv2 and VRRPv3 IPv4 advertisements being sent. Transition mode is only available on VRRPv3 for interoperability with VRRPv2 while upgrading to VRRPv3.
false	Transition mode is disabled. This stops VRRPv2 IPv4 advertisements being sent. Only VRRPv3 advertisements are sent when disabled. Disable transition-mode after upgrading from VRRPv2 to VRRPv3.

**Default** The default is **false**.

**Mode** Router Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- further information about configuring transition mode to upgrade from VRRPv2 to VRRPv3

**Examples** The example below shows you how to configure IPv4 transition-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode true
```

The example below shows you how to configure IPv4 transition-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode false
```

**Related commands** [router vrrp \(interface\)](#)

# undebug vrrp

**Overview** Use this command to disable all VRRP debugging.

**Syntax** undebug vrrp all

**Mode** Privileged Exec

**Example** The example below shows you how to disable all VRRP debugging:

```
awplus# undebug vrrp all
```

**Related commands** [debug vrrp](#)

# undebbug vrrp events

**Overview** Use this command to disable debugging options for VRRP event troubleshooting.

**Syntax** `undebbug vrrp events`

**Mode** Privileged Exec

**Example** The example below shows you how to disable VRRP event debugging:

```
awplus# undebbug vrrp events
```

**Related commands** [debug vrrp events](#)

# undebg vrrp packet

**Overview** Use this command to disable debugging options for VRRP packets.

**Syntax** `undebg vrrp packet [send|recv]`

Parameter	Description
send	Disable the debug option set for sent packets.
recv	Disable the debug option set for received packets.

**Mode** Privileged Exec

**Examples** The example below shows you how to disable VRRP sent packet debugging:

```
awplus# undebg vrrp packet send
```

The example below shows you how to disable VRRP received packet debugging:

```
awplus# undebg vrrp packet recv
```

The example below shows you how to disable all VRRP packet debugging:

```
awplus# undebg vrrp packet
```

**Related commands** [debug vrrp packet](#)

# virtual-ip

**Overview** Use this command to set the virtual IP address for the VRRP session. This is the IP address of the virtual router that end hosts set as their default gateway.

Use the **no** variant of this command to disable this feature.

**Syntax** `virtual-ip <ip-address> [master|backup|owner]`  
`no virtual-ip`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The virtual IPv4 address of the virtual router, entered in dotted decimal format A.B.C.D.
<code>master</code>	Sets the default state of the VRRP router within the Virtual Router as <b>master</b> . For master, the router must own the Virtual IP address. Specify the <b>owner</b> option before using <b>master</b> option.
<code>backup</code>	Sets the default state of the VRRP router within the Virtual Router as <b>backup</b> .
<code>owner</code>	Sets the IPv6 address of the VRRP router within the Virtual Router as the <b>owner</b> . Specify this before using the <b>master</b> option.

**Mode** Router Configuration

**Usage notes** The VRRP master and owner of the virtual IPv4 address for the VRRP session only responds to the packets destined to the virtual IPv4 address. The VRRP master that is not an owner of the virtual IPv4 address for the VRRP session does not respond to the packets destined to the virtual IPv4 address, but forwards packets with a VMAC as the destination address. See the [vrrp vmac](#) command to enable and disable this feature.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Examples** The example below shows you how to set the virtual IP address for VRRP VR ID 5 and the router as the VRRP master:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 master
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as the VRRP backup:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 backup
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as owner of the virtual IPv4 address:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 owner
```

The example below shows you how to disable the virtual IPv4 address for VRRP VR ID 5

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no virtual-ip
```

**Related commands**

- [router vrrp \(interface\)](#)
- [enable \(VRRP\)](#)
- [vrrp vmac](#)

# virtual-ipv6

**Overview** Use this command to set the virtual IPv6 address for the VRRPv3 session. This is the IPv6 address of the virtual router that end hosts set as their default gateway.

Note that the primary IPv6 address specified is an IPv6 link-local address. See the Usage note below for further information.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
virtual-ipv6 <ipv6-address> [master|backup]
[primary|secondary]

no virtual-ipv6
```

Parameter	Description
<ipv6-address>	The IPv6 address of the virtual router, entered in hexadecimal, in the format X:X::X.X.
master	Sets <b>master</b> to be the default state of the VRRPv3 router within the Virtual Router. For <b>master</b> , we recommend using a Virtual IP address that is not owned by any of the VRRP routers in the same grouping (that share the same VRID).
backup	Sets <b>backup</b> to be the default state of the VRRPv3 router within the Virtual Router.
primary	Sets the specified address as the primary IPv6 address. The primary address must be a link-local IPv6 address.
secondary	Sets the specified address as the secondary IPv6 address. Normally this would be a globally-routable IPv6 address. This enables you to specify a globally-routable address as the default gateway address for all the hosts on a VLAN.

**Mode** Router Configuration

**Usage notes** The virtual router will reply to ping, telnet, and SSH requests to the virtual IP address. The virtual router will reply even if it does not own the virtual IP address.

The AlliedWare Plus VRRPv3 implementation supports one IPv6 virtual link local address per virtual router ID. Note that in the command examples fe80::1 is an IPv6 link-local address. An IPv6 link-local address is used because IPv6 link-local addresses are used by IPv6 ND (Neighbor Discovery). A host's default route to a router points to the IPv6 link- local address, not a specific global IPv6 address for the router. For the host's traffic to switch over to a backup router, the IPv6 link-local address of the router is used by VRRPv3.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Examples** The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 master:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 master
```

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 backup:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 backup
```

The example below shows you disable the virtual IPv6 address for VRRPv3 VR ID 3:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no virtual-ipv6
```

**Related commands**

- [router ipv6 vrrp \(interface\)](#)
- [enable \(VRRP\)](#)
- [vrrp vmac](#)

## vrrp vmac

**Overview** Use this command to enable or disable the VRRP Virtual MAC feature. This feature is used by VRRP to make the hosts use the virtual MAC address as the physical hardware address of their gateway.

A VRRP router master will use the virtual MAC address for any ARP responses associated with the virtual IP address, or any gratuitous ARPs sent on behalf of the virtual IP address.

All VRRP advertisements are sent using this virtual MAC address as the source MAC address.

The virtual MAC address has the form 00:00:5e:00:01:<VRID>, where VRID is the ID of the Virtual Router.

**Syntax** `vrrp vmac {enable|disable}`

**Mode** Global Configuration

**Examples** To enable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac enable
```

To disable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac disable
```

# debug epsr

**Overview** This command enables EPSR debugging.  
The **no** variant of this command disables EPSR debugging.

**Syntax** debug epsr {info|msg|pkt|state|timer|all}  
no debug epsr {info|msg|pkt|state|timer|all}

Parameter	Description
info	Send general EPSR information to the console. Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above information from being sent to the console.
msg	Send the decoded received and transmitted EPSR packets to the console. Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above packets from being sent to the console.
pkt	Send the received and transmitted EPSR packets as raw ASCII text to the console. Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above packets from being sent to the console.
state	Send EPSR state transitions to the console. Using this parameter with the <b>no debug epsr</b> command will explicitly exclude state transitions from being sent to the console.
timer	Send EPSR timer information to the console. Using this parameter with the <b>no debug epsr</b> command will explicitly exclude timer information from being sent to the console.
all	Send all EPSR debugging information to the console. Using this parameter with the <b>no debug epsr</b> command will explicitly exclude any debugging information from being sent to the console.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable state transition debugging, use the command:

```
awplus# debug epsr state
```

To disable EPSR packet debugging, use the command:

```
awplus# no debug epsr pkt
```

**Related commands** [undebug epsr](#)

# epsr

**Overview** This command sets the timer values for an EPSR instance. These are only valid for master nodes.

**Syntax** `epsr <epsr-instance> {hellotime <1-32767>|failovertime <2-65535> ringflaptime <0-65535>}`  
`no epsr <epsr-instance>`

**CAUTION:** Using the no variant of this command will remove the specified EPSR instance.

Parameter	Description
<code>&lt;epsr-instance&gt;</code>	Name of the EPSR instance.
<code>hellotime &lt;1-32767&gt;</code>	The number of seconds between the transmission of health check messages.
<code>failovertime &lt;2-65535&gt;</code>	The number of seconds that a master waits for a returning health check message before entering the failed state. <b>The failover time should be greater than twice the hellotime.</b> This is to force the master node to wait until it detects the absence of two sequential healthcheck messages before entering the failed state.
<code>ringflaptime &lt;0-65535&gt;</code>	The minimum number of seconds that a master must remain in the failed state.

**Mode** EPSR Configuration

**Examples** To set the hellotimer to 5 seconds for the EPSR instance called blue, use the command:

```
awplus(config-epsr)# epsr blue hellotime 5
```

**NOTE:** When stacking is used with EPSR, the EPSR **failovertime** should be at least 5 seconds.

To delete the EPSR instance called blue, use the command:

```
awplus(config-epsr)# no epsr blue
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [epsr configuration](#)
- [epsr datavlan](#)
- [epsr state](#)
- [epsr trap](#)

`show epsr`

# epsr configuration

**Overview** Use this command to enter EPSR Configuration mode so that EPSR can be configured.

**Syntax** `epsr configuration`

**Mode** Global Configuration

**Example** To change to EPSR mode, use the command:

```
awplus(config)# epsr configuration
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr](#)  
[show epsr](#)

# epsr datavlan

**Overview** This command adds a data VLAN or a range of VLAN identifiers to a specified EPSR instance.

The **no** variant of this command removes a data VLAN or data VLAN range from an EPSR instance.

**Syntax** `epsr <epsr-instance> datavlan {<vlanid>|<vlanid-range>}`  
`no epsr <epsr-instance> datavlan {<vlanid>|<vlanid-range>}`

Parameter	Description
<code>&lt;epsr-instance&gt;</code>	Name of the EPSR instance.
<code>datavlan</code>	Adds a data VLAN to be protected by the EPSR instance.
<code>&lt;vlanid&gt;</code>	The VLAN's VID - a number between 1 and 4094 excluding the number selected for the control VLAN.
<code>&lt;vlanid-range&gt;</code>	Specify a range of VLAN identifiers using a hyphen to separate identifiers.

**Mode** EPSR Configuration

**Usage notes** We recommend you

- set the EPSR control VLAN to `vlan2`, using the [epsr mode master controlvlan primary port](#) and [epsr mode transit controlvlan](#) commands, then
- set the EPSR data VLAN between to be a value between 3 and 4094, using the [epsr datavlan](#) command.

**Examples** To add `vlan3` to the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan3
```

To add `vlan2` and `vlan3` to the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan2-vlan3
```

To remove `vlan3` from the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan3
```

To remove `vlan2` and `vlan3` from the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan2-vlan3
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[show epsr](#)

# epsr enhancedrecovery enable

**Overview** This command enables EPSR's enhanced recovery mode. Enhanced recovery mode enables a ring to apply additional recovery procedures when a ring with more than one break partially mends. For more information, see the [EPSR Feature Overview and Configuration Guide](#).

The **no** variant of this command disables the enhanced recovery mode.

**Syntax** `epsr <epsr-instance> enhancedrecovery enable`  
`no epsr <epsr-instance> enhancedrecovery enable`

Parameter	Description
<code>&lt;epsr-instance&gt;</code>	Name of the EPSR instance.

**Default** Default is that enhanced recovery mode disabled.

**Mode** EPSR Configuration

**Example** To apply enhanced recovery on the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue enhancedrecovery enable
```

**Related commands** `show epsr`

# epsr flush-type

**Overview** Use this command to set how EPSR flushes Layer 2 entries when a topology change occurs. It can be configured to flush all Layer 2 entries on its EPSR interfaces or only flush the Layer 2 entries on its EPSR data VLANs.

Use the **no** variant of this command to revert to the default setting.

**Syntax** `epsr <epsr-name> flush-type {interface|vlan}`  
`no epsr <epsr-name> flush-type`

Parameter	Description
<epsr-name>	The name of the EPSR instance to set the flush-type for.
interface	Flush all Layer 2 entries from the EPSR interface on a topology change.
vlan	Flush the Layer 2 entries on the EPSR interface and data VLANs on a topology change.

**Default** The default flush-type is vlan

**Mode** EPSR Configuration

**Usage notes** To flush all entries on the EPSR interface (including non-EPSR data VLANs) the flush-type command must be explicitly configured on the EPSR ring with the **interface** parameter.

Select **interface** as the flush-type to help reduce latency caused during EPSR topology changes. This type of flushing is quicker and less granular than flushing per data vlan, as flushing on a data **vlan** may incur a higher overhead, reducing EPSR responsiveness to ring topology changes.

Interface flushing can be used to optimize EPSR rings with a large number of VLANs. It will however also require relearning on any VLANs that are on an EPSR interface but not part of the EPSR configuration.

**Example** To configure the behavior of EPSR ring 'red' transit node on topology changes to flush all Layer 2 entries on its EPSR ring interfaces, use the following commands:

```
awplus# configure terminal
awplus(config)# epsr configuration
awplus(config-epsr)# epsr red mode transit controlvlan 10
awplus(config-epsr)# epsr red datavlan 20-29
awplus(config-epsr)# epsr red flush-type interface
awplus(config-epsr)# epsr red state enable
```

**Related commands** [show epsr](#)

**Command changes** Version 5.4.9-1.1: command added

# epsr mode master controlvlan primary port

**Overview** This command creates a master EPSR instance.

**NOTE:** This command will only run on switches that are capable of running as an EPSR master node. However, even if your switch cannot function as an EPSR master node, you still need to configure this command on whatever switch is the master within your EPSR network.

**Syntax** `epsr <epsr-instance> mode master controlvlan <2-4094>  
primaryport <port>`

Parameter	Description
<code>&lt;epsr-instance&gt;</code>	Name of the EPSR instance.
<code>mode</code>	Determines the node is acting as a master.
<code>master</code>	Sets switch to be the master node for the named EPSR ring.
<code>controlvlan</code>	The VLAN that will transmit EPSR control frames.
<code>&lt;2-4094&gt;</code>	VLAN id.
<code>primaryport</code>	Primary port for the EPSR instance.
<code>&lt;port&gt;</code>	The primary port. The port may be a switch port (e.g. port1.0.4) or a static channel group (e.g. sa3). It cannot be a dynamic (LACP) channel group.

**NOTE:** The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch or stacked node. However, we advise against this because in certain situations it can produce unpredictable results.

**Mode** EPSR Configuration

**Example** To create a master EPSR instance called blue with vlan2 as the control VLAN and port1.0.1 as the primary port, use the command:

```
awplus(config-epsr)# epsr blue mode master controlvlan vlan2
primaryport port1.0.1
```

**Related commands** [epsr mode transit controlvlan](#)  
[show epsr](#)

# epsr mode transit controlvlan

**Overview** This command creates a transit EPSR instance.

**Syntax** `epsr <epsr-instance> mode transit controlvlan <2-4094>`

Parameter	Description
<code>&lt;epsr-instance&gt;</code>	Name of the EPSR instance.
<code>mode</code>	Determines the node is acting as a transit node.
<code>transit</code>	Sets switch to be the transit node for the named EPSR ring.
<code>controlvlan</code>	The VLAN that will transmit EPSR control frames.
<code>&lt;2-4094&gt;</code>	VLAN id.

**NOTE:** The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch or stacked node. However, we advise against this because in certain situations it can produce unpredictable results.

If the control VLAN contains more than two ports (or static channels) an algorithm selects the two ports or channels with the lowest number to be the ring ports. However if the switch has only one channel group is defined to the control vlan, EPSR will not operate on the secondary port.

EPSR does not support Dynamic link aggregation (LACP).

**Mode** EPSR Configuration

**Example** To create a transit EPSR instance called `blue` with `vlan2` as the control VLAN, use the command:

```
awplus(config-epsr)# epsr blue mode transit controlvlan vlan2
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [show epsr](#)

# epsr priority

**Overview** This command sets the priority of an EPSR instance on an EPSR node. Priority is used to prevent “superloops” forming under fault conditions with particular ring configurations. Setting a node to have a priority greater than one, also has the effect of turning on **superloop protection**.

The **no** variant of this command returns the priority of the EPSR instance back to its default value of 0, which also disables EPSR Superloop prevention.

**Syntax** `epsr <epsr-instance> priority <0-127>`  
`no <epsr-instance> priority`

Parameter	Description
<code>&lt;epsr-instance&gt;</code>	Name of the EPSR instance.
<code>priority</code>	The priority of the ring instance selected by the <code>epsr-name</code> parameter.
<code>&lt;0-127&gt;</code>	The priority to be applied (0 is the lowest priority and represents no superloop protection).

**Default** The default priority of an EPSR instance on an EPSR node is 0. The negated form of this command resets the priority of an EPSR instance on an EPSR node to the default value.

**Mode** EPSR Configuration

**Example** To set the priority of the EPSR instance called `blue` to the highest priority (127), use the command:

```
awplus(config-epsr)# epsr blue priority 127
```

To reset the priority of the EPSR instance called `blue` to the default (0), use the command:

```
awplus(config-epsr)# no epsr blue priority
```

**Related commands** [epsr configuration](#)

# epsr state

**Overview** This command enables or disables an EPSR instance.

**Syntax** `epsr <epsr-instance> state {enabled|disabled}`

Parameter	Description
<code>&lt;epsr-instance&gt;</code>	The name of the EPSR instance.
<code>state</code>	The operational state of the ring.
<code>enabled</code>	EPSR instance is enabled.
<code>disabled</code>	EPSR instance is disabled.

**Mode** EPSR Configuration

**Usage notes** In a super-loop protection scenario, if you have:

- a device on the common segment acting as the master node for multiple EPSR rings,
- and you disable the rings and later re-enable them (e.g., when doing EPSR configuration changes),
- then you must re-enable the ring with the highest EPSR SLP priority **last**.

If you do not re-enable the rings in that order, the primary port may end up permanently in a blocking state. If the primary port does end up in a permanent blocking state, recover by disabling and re-enabling the EPSR ring that has the highest priority.

**Example** To enable the EPSR instance called 'blue', use the command:

```
awplus(config-epsr)# epsr blue state enabled
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)

# epsr topology-change

**Overview** Use this command to allow the given EPSR instance to accept notifications from other topology protocols, namely G.8032, for Topology Change Notifications (TCN).

Use the **no** variant of this command to return the EPSR instance to where it does not accept TCNs from the other specified protocol, and as a result does not send out a “flush FDB” message.

**Syntax** `epsr <epsr-name> topology-change g8032`  
`no epsr <epsr-name> topology-change g8032`

Parameter	Description
<code>&lt;epsr-name&gt;</code>	The name of the EPSR instance for which the topology-change applies to.
<code>topology-change</code>	The topology-change value to be set for the instance.
<code>g8032</code>	Specify that G.8032 is the other protocol that the topology-change notifications are allowed to be accepted from in order to send "flush FDB" messages to other EPSR nodes in the ring.

**Default** The default value is no notifications are accepted and in turn no “flush FDB” messages are sent.

**Mode** EPSR Configuration

**Usage notes** The purpose of this command is to allow EPSR to accept notifications from other topology protocols, namely G.8032, about Topology Change Notifications (TCN). Once EPSR accepts the TCN, it will in turn notify the other nodes on the EPSR ring to perform an FDB flush.

**Example** To configure an EPSR instance named “red” to accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# epsr red topology-change g8032
```

To configure an EPSR instance named “red” to no longer accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# no epsr red topology-change g8032
```

**Related commands** [show epsr](#)  
[show g8032 erp-instance](#)

**Command changes** Version 5.4.7-1.1: command added

## epsr trap

**Overview** This command enables SNMP traps for an EPSR instance. The traps will be sent when the EPSR instance changes state.

The **no** variant of this command disables SNMP traps for an EPSR instance. The traps will no longer be sent when the EPSR instance changes state.

**Syntax** `epsr <epsr-instance> trap`  
`no epsr <epsr-instance> trap`

Parameter	Description
<code>&lt;epsr-instance&gt;</code>	Name of the EPSR instance.
<code>trap</code>	SNMP trap for the EPSR instance.

**Mode** EPSR Configuration

**Example** To enable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue trap
```

To disable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue trap
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[show epsr](#)

# show debugging epsr

**Overview** This command shows the debugging modes enabled for EPSR.

**Syntax** `show debugging epsr`

**Mode** User Exec and Privileged Exec

**Example** To show the enabled debugging modes, use the command:

```
awplus# show debugging epsr
```

**Related commands** [debug epsr](#)

# show epsr

**Overview** This command displays information about all EPSR instances.

**Syntax** show epsr

**Mode** User Exec and Privileged Exec

**Example** To show the current settings of all EPSR instances, use the command:

```
awplus# show epsr
```

**Output:** The following examples show the output display for a non-superloop topology network.  
**non-superloop topology**

**Table 1:** Example output from the **show epsr** command run on a transit node

EPSR Information	
Name .....	test2
Mode .....	Transit

```

**Table 5:** Parameters displayed in the output of the **show epsr** command

Parameter on Master Node	Parameter on Transit Node	Description
Name	Name	The name of the EPSR instance.
Mode	Mode	The mode in which the EPSR instance is configured - either Master or Transit
Status	Status	Indicates whether the EPSR instance is enabled or disabled
State	State	Indicates state of the EPSR instance's state machine. Master states are: Idle, Complete, and Failed. Transit states are Links-Up, Links-Down, and Pre-Forwarding.
Control Vlan	Control Vlan	Displays the VID of the EPSR instance's control VLAN.
Data VLAN(s)	Data VLAN(s)	The VID(s) of the instance's data VLANs.
Interface Mode	Interface Mode	Whether the EPSR instance's ring ports are both physical ports (Ports Only) or are both static aggregators (Channel Groups Only).
Primary Port	First Port	The EPSR instance's primary ring port.

**Table 5:** Parameters displayed in the output of the **show epsr** command (cont.)

Parameter on Master Node	Parameter on Transit Node	Description
- Status	- Status	Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port because it does not have physical control of it.
	- Direction	The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"
- Is On Common Segment	- Is On Common Segment	Whether the ring port is on a shared common segment link to another node, and if so, "(highest rank)" indicates it is the highest priority instance on that common segment.
- Blocking Control	- Blocking Control	Whether the instance has "physical" or "logical" control of the ring port's blocking in the instance's data VLANs.
Secondary Port	Second Port	The EPSR instance's secondary port.
- Status	- Status	Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port, because it does not have physical control of it. Note that on a master configured for SuperLoop Prevention (non-zero priority) its secondary ring port can be physically forwarding, but logically blocking. This situation arises when it is not the highest priority node in the topology (and so does not receive LINKS-DOWN messages upon common segment breaks) and a break on a common segment in its ring is preventing reception of its own health messages.
	- Direction	The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"
- Is On Common Segment	- Is On Common Segment	Whether the ring port is on a shared common segment link to another node, and if so, "(highest rank)" indicates it is the highest priority instance on that common segment
- Blocking Control	- Blocking Control	Whether the instance has "physical" or "logical" control of the ring port's blocking in the instance's data VLANs
Hello Time		The EPSR instance's setting for the interval between transmissions of health check messages (in seconds)
Failover Time		The time (in seconds) the EPSR instance waits to receive a health check message before it decides the ring is down
Ring Flap Time		The minimum time the EPSR instance must remain in the failed state
Trap	Trap	Whether the EPSR instance has EPSR SNMP traps enabled

**Table 5:** Parameters displayed in the output of the **show epsr** command (cont.)

Parameter on Master Node	Parameter on Transit Node	Description
Enhanced Recovery	Enhanced Recovery	Whether the EPSR instance has enhanced recovery mode enabled
SLP Priority	SLP Priority	The EPSR instance's priority (for SuperLoop Prevention)

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [show epsr counters](#)

# show epsr common segments

**Overview** This command displays information about all the superloop common segment ports on the switch.

**Syntax** `show epsr common segments`

**Example** To display information about all the superloop common segment ports on the switch, use the command:

```
awplus# show epsr common segments
```

**Table 6:** Example output from the **show epsr common segments** command

EPSR Common Segments						
Common Seg Ring Port	EPSR Instance	Mode	Prio	Port Type	Phys Ctrl of Port?	Ring Port Status
port1.0.4	test_inst_Red	Transit	127	Second	Yes	Fwding
	test_inst_Blue	Transit	126	Second	No	Fwding (logical)
	test_inst_Green	Transit	125	First	No	Fwding (logical)
sa4	testA	Master	15	Primary	Yes	Blocking
	testB	Transit	14	Second	No	Fwding (logical)
sa5	test_55	Transit	8	First	Yes	Down
	test_77	Transit	7	First	No	Down

**Related commands**

- [show epsr](#)
- [show epsr summary](#)
- [show epsr counters](#)

# show epsr config-check

**Overview** This command checks the configuration of a specified EPSR instance, or all EPSR instances.

If an instance is enabled, this command will check for the following errors or warnings:

- The control VLAN has the wrong number of ports.
- There are no data VLANs.
- Some of the data VLANs are not assigned to the ring ports.
- The failover time is less than 5 seconds for a stacked device.
- The instance is a master with its secondary port on a common segment.

**Syntax** `show epsr [<instance>] config-check`

Parameter	Description
<instance>	Name of the EPSR instance to check on.

**Mode** User Exec and Privileged Exec

**Example** To check the configuration of all EPSR instances and display the results, use the command:

```
awplus# show epsr config-check
```

Table 59-1: Example output from **show epsr config-check**

EPSR Instance	Status	Description
red	Warning	Failover time is 2s but should be 5s because device is stacked.
white	OK.	
blue	Warning	Primary port is not in data VLANs 29-99.
orange	OK.	

Don't forget to check that this node's configuration is consistent with all other nodes in the ring.

**Related commands** [show epsr](#)

# show epsr <epsr-instance>

**Overview** This command displays information about the specified EPSR instance.

**Syntax** `show epsr <epsr-instance>`

Parameter	Description
<code>&lt;epsr-instance&gt;</code>	Name of the EPSR instance.

**Mode** User Exec and Privileged Exec

**Example** To show the current settings of the EPSR instance called `blue`, use the command:

```
awplus# show epsr blue
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [show epsr counters](#)

# show epsr <epsr-instance> counters

**Overview** This command displays counter information about the specified EPSR instance.

**Syntax** `show epsr <epsr-instance> counters`

Parameter	Description
<code>&lt;epsr-instance&gt;</code>	Name of the EPSR instance.

**Mode** User Exec and Privileged Exec

**Example** To show the counters of the EPSR instance called `blue`, use the command:

```
awplus# show epsr blue counters
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [show epsr](#)

# show epsr counters

**Overview** This command displays counter information about all EPSR instances.

**Syntax** `show epsr counters`

**Mode** User Exec and Privileged Exec

**Example** To show the counters of all EPSR instances, use the command:

```
awplus# show epsr counters
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [show epsr](#)

# show epsr summary

**Overview** This command displays summary information about all EPSR instances on the switch

**Syntax** show epsr summary

**Mode** User Exec and Privileged Exec

**Example** To display EPSR summary information, use the command:

```
awplus# show epsr summary
```

**Table 60:** Example output from the **show epsr summary** command

```
EPSR Summary Information

Abbreviations:
M = Master node
T = Transit node
C = is on a common segment with other instances
P = instance on a common segment has physical control of the shared port's
 data VLAN blocking
LB = ring port is Logically Blocking - applicable to master only
```

EPSR Instance	Mode	Status	State	Ctrl VLAN	Prio	Primary/1st Port Status	Secondary/2nd Port Status
test-12345	T	Enabled	Links-Down	6	127	Blocking (C,P)	Blocking (C,P)
test1	M	Enabled	Complete	5	12	Fwding	Fwding (LB)
test2	T	Enabled	Pre-Fwding	4	126	Fwding (C)	Blocking (C)
localB	T	Disabled	Idle	40	0	Unknown	Unknown
localC	T	Disabled	Idle	41	0	Unknown	Unknown

# cfm-sf-notify

**Overview** Use this command to configure this ERP instance to receive signal fail notifications from a Local MEP(s). This command can be used multiple times to allow multiple Local MEPs to be specified.

Use the **no** variant of this command to remove a Local MEP from sending notifications to this G.8032 ERP instance.

**Syntax** `cfm-sf-notify mep mpid <mep-id> domain <domain-name> service <ma-name>`  
`no cfm-sf-notify mep mpid <mep-id> domain <domain-name> service <ma-name>`

Parameter	Description
mep	Specify that a Local Maintenance End Point (MEP) is to provide the Signal Fail notification to this G.8032 ERP instance.
mpid	Specify that the Local MEP is to be identified by MEP-id.
<mep-id>	1-8191. Specify the Local MEP's ID.
domain	Specify the Maintenance Domain that the Local MEP is associated with.
<domain-name>	Specify the Maintenance Domain's CLI instance name.
service	Specify the Maintenance Association that the Local MEP is associated with.
<ma-name>	Specify the Maintenance Association's CLI instance name.

**Mode** G8032 Configure Switch

**Usage notes** CFM and Continuity Check Messaging (CCM) can be configured to detect link faults on the East or West interface ports as a whole, or faults on the R-APS VLAN on the East or West interface. In this situation CFM Local MEPs can notify G.8032 of defects it detects. G.8032 will treat these notifications as a Signal Fail (SF) for that East or West ring port. Similarly, CFM Local MEPs can notify G.8032 that the fault has cleared. When this command is used, this G.8032 ERP instance will ensure that the specified Local MEP is a Down MEP for the East or West interface used by this instance or for the R-APS VLAN on the East or West interface used by this instance.

**Example** To configure an ERP instance to receive signal fail notifications from a local MEP with an MEP ID of "12", an MD named "MD-INST1", and an MA named "MA-INST1-1", use the following commands:

```
awplus(config)# g8032 erp-instance ring2
awplus(g8032-config-switch)# cfm-sf-notify mep mpid 12 domain
MD-INST1 service MA-INST1-1
```

**Related commands**

- ethernet cfm domain-name
- ethernet cfm mep
- g8032 erp-instance
- service ma-name
- show g8032 erp-instance

**Command changes**

- Version 5.4.7-0.1: command added
- Version 5.4.7-1.1: added to x310 series products
- Version 5.4.7-2.1: added to x550 series products
- Version 5.4.8-0.2: added to SBx8100 series products
- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear g8032 erp-instance

**Overview** Use this command to:

- trigger a reversion immediately, without waiting for timers to expire, or
- clear a forced-switch or manual-switch command that was previously successfully entered on a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `clear g8032 erp-instance <erp-instance-name>`

Parameter	Description
<code>&lt;erp-instance-name&gt;</code>	The name of the G.8032 ERP instance

**Mode** Privileged Exec

**Usage notes** This command can be used after a protection switch has occurred and the failure has cleared. If reversion is enabled, this command will trigger a reversion immediately, without having to wait for certain timers to expire (such as WTB or WTR). If reversion has been disabled, this command will trigger a reversion.

Alternatively, this command can be used on an ERP instance where a forced-switch or manual-switch command has been successfully entered to clear that action. The command will be ignored if a force-switch or manual-switch command had not been previously entered successfully, even if such node is in the FORCED\_SWITCH or MANUAL\_SWITCH state.

**Examples** To trigger a reversion immediately without waiting for a timer to expire on an ERP instance named "blue", use the following command:

```
awplus# clear g8032 erp-instance blue
```

Alternatively, to clear a previously applied forced-switch from an ERP instance named "blue", use the following command:

```
awplus# clear g8032 erp-instance blue
```

The forced-switch would be created using a command like this one, which forces a protection switch on the East interface of an ERP instance named "blue":

```
awplus# g8032 forced-switch erp-instance blue east-interface
```

**Related commands** [g8032 erp-instance](#)  
[g8032 forced-switch erp-instance](#)  
[g8032 manual-switch erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear g8032 erp-instance statistics

**Overview** Use this command to clear the statistics data being collected by a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `clear g8032 erp-instance <erp-instance-name> statistics`

Parameter	Description
<code>&lt;erp-instance-name&gt;</code>	The name of a specific G.8032 ERP instance

**Mode** Privileged Exec

**Usage notes** A G.8032 ERP instance keeps statistical data as counts on a variety of data such as the number of certain types of Ring-Automatic Protection Switching (R-APS) messages sent and received over its ring port(s) and error conditions detected. Use this command to clear the statistics data.

**Example** To clear the statistics for an ERP instance named "blue", use the following command:

```
awplus# clear g8032 erp-instance blue statistics
```

**Related commands** [g8032 erp-instance](#)  
[show g8032 erp-instance statistics](#)

**Command changes**  
Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# data-traffic

**Overview** Use this command to add a data traffic VLAN or a range of VLANs to be protected by this G.8032 Ethernet Ring Protection (ERP) instance.

Use the **no** variant of this command to remove a data traffic VLAN or a range of VLANs.

**Syntax** `data-traffic <vid-list>`  
`no data-traffic <vid-list>`

Parameter	Description
<code>&lt;vid-list&gt;</code>	The data traffic VLAN ID(s). This can be a single VLAN ID, or can be a range of VLAN IDs separated by hyphen, or a comma separated list of VLAN IDs and ranges. Each VLAN ID can take on the range of 1 to 4094

**Mode** G8032 Configure Switch

- Usage notes**
- A G.8032 ERP instance can protect 0, 1 or more VLANs carrying data traffic.
  - This ERP instance must be associated with a physical ring instance.
  - Other ERP instances using the same physical ring instance are not allowed to have the same data traffic VLAN(s) as this ERP instance.
  - The data VLAN(s) must already exist.
  - The data VLAN(s)' port members should be members of the ring interface(s), but it is not enforced.
  - When a data traffic VLAN(s) is removed, any blocks that were in place on the ring ports for this VLAN(s) are removed. The user should make sure when removing the VLAN(s) from the ERP instance that a loop is not formed.
  - Data traffic VLAN(s) can be added or removed while the ERP instance is enabled or disabled.

**Example** To add a data traffic VLAN with a VLAN ID of "103" to an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# data-traffic 103
```

**Related commands** [g8032 erp-instance](#)  
[show g8032 erp-instance](#)

**Command changes**  
Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# debug g8032

**Overview** Use this command to enable G.8032 debugging.  
Use the **no** variant of this command to disable G.8032 debugging.

**Syntax** `debug g8032 {all|event|rx|tx}`  
`no debug g8032 {all|event|rx|tx}`

Parameter	Description
all	Turn on all G.8032 debugging
event	Turn on G.8032 Event debugging
rx	Turn on G.8032 Receive debugging
tx	Turn on G.8032 Transmit debugging

**Mode** Privileged Exec

**Example** To enable all G.8032 debugging, use the following command:

```
awplus# debug g8032 all
```

**Related commands** [show debugging](#)  
[show debugging g8032](#)  
[undebug g8032](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# enable (g8032-profile)

**Overview** Use this command to change the revertive or non-revertive operation of the associated G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `enable {revertive|non-revertive}`

Parameter	Description
<code>revertive</code>	This allows the ERP instance associated with this profile to operate in revertive mode.
<code>non-revertive</code>	This allows the ERP instance associated with this profile to operate in non-revertive mode.

**Default** By default, the mode of operation is revertive.

**Mode** G8032 Profile Configuration

**Usage notes** An ERP instance uses a profile which contains timer configurations and configurations for revertive modes of operation. Once a ring failure has abated, a G.8032 ring instance will check its mode of operation, and if the mode is revertive, it will attempt to revert back to where the RPL-Owner controls the blocking of the ring. Otherwise, it operates in non-revertive mode.

**Example** To enable revertive mode for a profile named "prof\_1", use the following commands:

```
awplus(config)# g8032 profile prof_1
awplus(g8032-profile-config)# enable revertive
```

**Related commands** [g8032 profile](#)  
[show g8032 profile](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# epsr topology-change

**Overview** Use this command to allow the given EPSR instance to accept notifications from other topology protocols, namely G.8032, for Topology Change Notifications (TCN).

Use the **no** variant of this command to return the EPSR instance to where it does not accept TCNs from the other specified protocol, and as a result does not send out a "flush FDB" message.

**Syntax** `epsr <epsr-name> topology-change g8032`  
`no epsr <epsr-name> topology-change g8032`

Parameter	Description
<code>&lt;epsr-name&gt;</code>	The name of the EPSR instance for which the topology-change applies to.
<code>topology-change</code>	The topology-change value to be set for the instance.
<code>g8032</code>	Specify that G.8032 is the other protocol that the topology-change notifications are allowed to be accepted from in order to send "flush FDB" messages to other EPSR nodes in the ring.

**Default** The default value is no notifications are accepted and in turn no "flush FDB" messages are sent.

**Mode** EPSR Configuration

**Usage notes** The purpose of this command is to allow EPSR to accept notifications from other topology protocols, namely G.8032, about Topology Change Notifications (TCN). Once EPSR accepts the TCN, it will in turn notify the other nodes on the EPSR ring to perform an FDB flush.

**Example** To configure an EPSR instance named "red" to accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# epsr red topology-change g8032
```

To configure an EPSR instance named "red" to no longer accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# no epsr red topology-change g8032
```

**Related commands** [show epsr](#)  
[show g8032 erp-instance](#)

**Command changes** Version 5.4.7-1.1: command added

# erp-instance

**Overview** Use this command to enable or disable a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `erp-instance {enabled|disabled}`

Parameter	Description
enabled	The G.8032 ERP instance is enabled
disabled	The G.8032 ERP instance is disabled

**Default** The ERP instance is disabled.

**Mode** G8032 Configure Switch

**Usage notes** Once a G.8032 ERP instance has been configured with the correct parameter settings or defaults, it can be enabled to run the G.8032 protocol. To change certain ERP instance parameters, the instance may need to be disabled.

When enabled, the instance is restarted back to the G8032\_ST\_INIT state. In this state, if the node has an RPL-Owner or RPL-Neighbor port, it will be blocked. Otherwise the node will block one of its ring ports. All the nodes will send Ring-Automatic Protection Switching (R-APS) messages initially. The G.8032 protocol and state machines will transition the ring into another more appropriate state.

When disabled, the ERP instance will no longer process incoming R-APS messages for that instance, nor send any R-APS messages. The raps-channel VLAN and any data-traffic VLANs used by this instance will be put in the forwarding state for its physical ring ports. Caution should be taken to avoid loops when disabling an ERP instance.

**Example** To enable an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# erp-instance enabled
```

**Related commands**

# g8032 erp-instance

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) instance, or to enter an existing instance's context.

Use the **no** variant of this command to destroy the specified instance.

**Syntax** `g8032 erp-instance <erp-instance-name>`  
`no g8032 erp-instance <erp-instance-name>`

Parameter	Description
<code>&lt;erp-instance-name&gt;</code>	The name of the G.8032 ERP instance. This can be up to 32 characters.

**Mode** Global Configuration

**Usage notes** The ERP protocol in AlliedWare Plus™ can run one or more instances. A G.8032 ERP instance is made up of:

- two ERP ring ports,
- a Control VLAN that carries Ring-Automatic Protection Switching (R-APS) messages, and
- zero, one, or more Protected traffic data VLANs that the instance protects when the ring fails.

An ERP instance must be associated with a G.8032 physical ring and a G.8032 profile.

**Example** To enter the context of an instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)#
```

**Related commands**

# g8032 forced-switch erp-instance

**Overview** Use this command to force a protection switch on a G.8032 Ethernet Ring Protection (ERP) instance ring port.

**Syntax** `g8032 forced-switch erp-instance <erp-instance-name>  
{east-interface|west-interface|terminating-interface}`

Parameter	Description
<code>&lt;erp-instance-name&gt;</code>	The name of the G.8032 ERP instance
<code>east-interface</code>	The G.8032 ERP instance's East ring port
<code>west-interface</code>	The G.8032 ERP instance's West ring port
<code>terminating-interface</code>	The G.8032 ERP instance's Terminating ring port

**Mode** Privileged Exec

**Usage notes** G.8032 supports a Forced Protection Switch action initiated by the operator. A Forced Protection Switch command is to be issued at a given G.8032 node and given port in the ring. This results in a block being applied at that ring port (and an unblock on the opposite ring port), and a R-APS designated Forced Switch message to flow around the ring causing the RPL to become unblocked.

Multiple Forced Switch actions can take place along a G.8032 ring. Care must be taken when using the Force Switch command as it can only be undone by issuing a Clear command and not by a failure nor the clearing of a failure. If a node that was issued a Force Switch command later fails, then it becomes difficult to remove the Force Switch condition from the ring. In this situation, the operator has to go to the nodes that are adjacent to the failed node, and for each one, issue a Forced Switch command on the ring link facing the failed node followed by a Clear command.

If the G.8032 Physical Ring instance associated with the specified ERP instance is set to terminating-interface, then only one ring port is available and terminating-interface must be used in this command, otherwise specify the east-interface or the west-interface.

To clear this action command, use the [clear g8032 erp-instance](#) command.

**Example** To issue a Forced Protection Switch on the East interface of an ERP instance named "blue", use the following command:

```
awplus# g8032 forced-switch erp-instance blue east-interface
```

**Related commands** [clear g8032 erp-instance](#)  
[g8032 erp-instance](#)

# g8032 manual-switch erp-instance

**Overview** Use this command to manually cause a protection switch on a G.8032 Ethernet Ring Protection (ERP) instance ring port.

**Syntax** `g8032 manual-switch erp-instance <erp-instance-name>  
{east-interface|west-interface|terminating-interface}`

Parameter	Description
<code>&lt;erp-instance-name&gt;</code>	The name of the G.8032 ERP instance
<code>east-interface</code>	The G.8032 ERP instance's East ring port
<code>west-interface</code>	The G.8032 ERP instance's West ring port
<code>terminating-interface</code>	The G.8032 ERP instance's Terminating ring port

**Mode** Privileged Exec

**Usage notes** G.8032 supports a Manual Protection Switch action initiated by the operator. A Manual Protection Switch command is to be issued at a given G.8032 node and given port in the ring. This results in a block being applied at that ring port (and an unblock on the opposite ring port), and a R-APS designated Manual Switch message to flow around the ring causing the RPL to become unblocked.

The difference between a Manual switch and a Forced switch is that the Manual Switch will be ignored under various conditions. In particular, only one Manual Switch is allowed on a G.8032 ring at a time.

If the G.8032 Physical Ring instance associated with the specified ERP instance is set to terminating-interface, then only one ring port is available and terminating-interface must be used in this command, otherwise specify the east-interface or the west-interface.

To clear this action command, use the [clear g8032 erp-instance](#) command.

**Example** To issue a Manual Protection Switch on the East interface of an ERP instance named "blue", use the following command:

```
awplus# g8032 manual-switch erp-instance blue east-interface
```

**Related commands** [clear g8032 erp-instance](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# g8032 physical-ring

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) physical ring profile which specifies the Ethernet ports that will be used as G.8032 ring ports.

**Syntax**

```
g8032 physical-ring <physical-ring-name> {east-interface <interface-name1> west-interface <interface-name2>| terminating-interface <interface-name>}
no g8032 physical-ring <physical-ring-name>
```

Parameter	Description
<physical-ring-name>	The name of the profile (up to 37 characters)
east-interface	The East G.8032 ring port
<interface-name1>	The name of the switch interface, either port or channel group, for the East ring port. It must differ from the West ring port.
west-interface	The West G.8032 ring port
<interface-name2>	The name of the switch interface, either port or channel group, for the West ring port. It must differ from the East ring port.
terminating-interface	The Terminating ring port. This should only be used for G.8032 ERP instance that is at the end of a sub-ring.
<interface-name>	The name of the switch interface, either port or channel group, for the Terminating ring port.

**Mode** Global Configuration

**Usage notes** Each ERP instance will be associated with a physical ring profile. A physical ring profile is made up of two physical Ethernet ports or aggregated interfaces, unless it is the terminating point of a sub-ring in which case only one port is needed. When two ports are used, they are referred to as East and West ports. When only a single port is used, it is referred to as a Terminating port.

**Example** To create a physical ring profile named "red" where the East interface port is port1.0.4 and the West interface port is port1.0.8, use the following commands:

```
awplus# configure terminal
awplus(config)# g8032 physical-ring red east-interface
port1.0.4 west-interface port1.0.8
```

# g8032 profile

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) instance profile, or to enter that instance's profile context.

Use the **no** variant of this command to destroy the specified instance.

**Syntax** `g8032 profile {<erp-profile-name>|default-profile}`  
`no g8032 profile <erp-profile-name>`

Parameter	Description
<code>&lt;erp-profile-name&gt;</code>	The name of the G.8032 profile. This can be up to 32 characters.
<code>default-profile</code>	The name of the system's default profile for G.8032. This profile is created by the system automatically and can not be destroyed.

**Default** A profile with the name "default-profile" will exist in the system and is used by default by an ERP instance. All the parameters in the default profile take on the default values.

**Mode** Global Configuration

**Example** To enter the context of a profile named "prof\_1", use the following commands:

```
awplus(config)# g8032 profile prof_1
awplus(g8032-profile-config)#
```

**Related commands** [enable \(g8032-profile\)](#)  
[profile name](#)  
[show g8032 profile](#)  
[timer \(g8032-profile\)](#)

**Command changes** Version 5.4.7-0.1: command added

Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# level (g8032-switch)

**Overview** Use this command to configure the level for Ring-Automatic Protection Switching (R-APS) messages.

**Syntax** level <0-7>

Parameter	Description
<0-7>	The level used by the G.8032 ERP instance.

**Default** The default level is 0.

**Mode** G8032 Configure Switch

**Usage notes** Inside the R-APS messages is the Level field. The G.8032 Ethernet Ring Protection (ERP) instance will use the configured level for sending R-APS messages, and is the level that the instance expects to receive. If the node receives an R-APS message with the improper level then the message will not be processed.

The ERP instance must be disabled to change the level, otherwise the setting is denied.

**Example** To set the R-APS message level field for an ERP instance named "blue" to 3, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# level 3
```

**Related commands** [g8032 erp-instance](#)  
[show g8032 erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products

Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# physical-ring

**Overview** Use this command to specify which G.8032 physical ring instance is to be used by this G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `physical-ring <physical-ring-name>`

Parameter	Description
<code>&lt;physical-ring-name&gt;</code>	The name of the physical ring instance.

**Mode** G8032 Configure Switch

**Usage notes** A G.8032 ERP instance in general has two ring ports, unless it is at the end of a sub-ring in which case it has only one ring port. Ring port(s) are specified using a G.8032 physical ring instance.

This command can only be accepted when the ERP instance is disabled.

**Example** To configure an ERP instance named "blue" to use a physical ring instance named "red", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# physical-ring red
```

- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# profile name

**Overview** Use this command to associate a G.8032 profile instance with this G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `profile name <erp-profile-name>`

Parameter	Description
<code>&lt;erp-profile-name&gt;</code>	The name of the G.8032 profile

**Default** If this command is not used, a profile with the name "default-profile" will be used for this G.8032 ERP instance.

**Mode** G8032 Configure Switch Mode

**Usage notes** A G.8032 ERP instance uses a profile which contains timer configurations and configurations for revertive modes of operation. This configuration can be accepted regardless of the ERP instance being disabled or enabled. Any parameters from a changed profile will take effect the next time the G.8032 state machine uses the parameters in the updated profile.

**Example** To associate a G.8032 profile named "prof\_1" with a G.8032 ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# profile name prof_1
```

- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# raps-channel

**Overview** Use this command to specify which VLAN to use as a channel for G.8032 Ring-Automatic Protection Switching (R-APS) messages sent and received by this G.8032 Ethernet Ring Protection (ERP) instance.

Use the **no** variant of this command to remove the VLAN from being used as the R-APS channel VLAN.

**Syntax** `raps-channel <vid>`  
`no raps-channel`

Parameter	Description
<code>&lt;vid&gt;</code>	A single VLAN-id in the range 2 to 4094.

**Mode** G8032 Configure Switch

**Usage notes** For a G.8032 ERP instance, a VLAN is used as a channel for carrying an R-APS message. This VLAN is also used to identify the proper ring instance to all the other nodes in the ring.

The VLAN must be tagged members of the G.8032 physical ring instance associated with this ERP instance. A G.8032 physical ring instance must be associated with this ERP instance. The ERP instance can not be enabled until this raps-channel VLAN has been configured properly.

The ERP instance must be disabled when using the **no** variant.

**Example** To configure a VLAN with a VLAN-id of "103" as a R-APS channel for an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# raps-channel 103
```

**Related commands** [g8032 erp-instance](#)

**Command changes**  
Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# service onm

**Overview** Use this command to enable the ONM service, which underlies CFM and G.8032. Use the **no** version of the command to disable the unused ONM service.

**Syntax** `service onm`  
`no service onm`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Disabling the service can reduce memory usage on the switch, particularly when many VLANs are configured on ports.

Disabling the service will only take effect after you save the configuration and restart the device.

**Example** To disable the ONM service, use the commands:

```
awplus# configure terminal
awplus(config)# no service onm
```

**Output** Figure 60-1: Example output from **no service onm**

```
awplus(config)#no service onm
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-2.1: command added

# rpl role

**Overview** Use this command to specify the role of each G.8032 Ethernet Ring Protection (ERP) ring port (also known as a link). The role can be specified as to whether it is a Ring Protection Link (RPL) or not, and if it is an RPL, whether it is the Owner or Neighbor end of an RPL.

Use the **none** variant of this command to set all the ERP instance's ring ports' RPL role to **none**.

**Syntax** `rpl role {owner|neighbor}{east-interface|west-interface|terminating-interface}`  
`rpl role none`

Parameter	Description
owner	This sets the specified ring port to be an RPL Owner
neighbor	This sets the specified ring port to be an RPL Neighbor
east-interface	The ring port's east-interface.
west-interface	The ring port's west-interface.
terminating-interface	The ring port's terminating-interface
none	This sets all the ERP instance's ring ports' RPL role to none.

**Default** A RPL role of "none" is the default.

**Mode** G8032 Configure Switch

**Usage notes** If a node has one of its ring ports set to Owner or Neighbor, then **none** is automatically set on any other ring port as **none** is the only possible setting for the other ring port.

When using this command to set the RPL role to **none**, an interface need not be specified, as this command will set all the ring ports RPL role to **none**.

The command can only be accepted when the G.8032 ERP Instance is disabled, and the ERP instance must also have an association to a ERP Physical Ring instance.

As in the case of a sub-ring with only one physical ring port, use **terminating-interface** when specifying the RPL role as Owner or Neighbor.

**Example** To configure the east-interface of a ring port named "blue" to be an RPL Owner, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# rpl role owner east-interface
```

# show g8032 erp-instance

**Overview** Use this command to show one or all G.8032 Ethernet Ring Protection (ERP) instance(s) configuration and dynamic state data.

**Syntax** `show g8032 erp-instance {<erp-instance-name>|all}`

Parameter	Description
<code>&lt;erp-instance-name&gt;</code>	The name of a specific G.8032 ERP instance.
<code>all</code>	Use this to show all instances.

**Mode** User Exec and Privileged Exec

**Example** To show the configuration and dynamic state data for an ERP instance named "blue", use the following command:

```
awplus# show g8032 erp-instance blue
```

**Output** Figure 60-3: Example output from the **show g8032 erp-instance** command.

```
awplus#show g8032 erp-instance blue

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command.

Parameter	Description
Instance name	The configured <erp-instance-name> for this instance.
Admin State	The configured administrative state of this instance, either enabled or disabled. When the ERP instance is disabled, all dynamic data for other parameters in this table will be shown as "-", except for the East Link or West Link which will show the last known block or unblocked state.
G.8032 State	A dynamic parameter showing the current state of the instance per the G.8032 state machine. If the ERP Instance is disabled, it will be in the INIT state.
Phy Ring	Shows the Physical Ring Instance name that this ERP Instance is associated with along with the East/West or Terminating Interface used by the Physical Ring Instance.
East Link or West Link	A dynamic variable showing whether the instance's ring port and its VLANs are blocked or not. In the special case of an interconnection node where a sub-ring terminates, both the East Link and the West Link are the same.
RPL Role East Link or West Link	Shows the configuration of the link's role.

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command. (cont.)

Parameter	Description
CFM MEP East or West	Identifies the configured MEP, if any, that is being used to provide a CFM based Signal Fail indication to this instance. The MEP is identified by its direction (Up or Down), its MEP-id, and the Maintenance Domain (MD) and Maintenance Association (MA) it is associated with by name.
ERP Profile	Identifies the ERP Profile instance that was configured for use by this ERP Ring instance.
Level	The Level that was configured for R-APS messages that are used by this ERP Ring instance.
Ring-ID	The Ring-ID that is to be used by this ERP instance.
RAPS-Channel VLAN	The VLAN-id that is configured used for sending and receiving R-APS messages for this ERP instance.
Sub-ring	Specifies whether the ring is operating as a Sub-ring or otherwise as a Major ring.
Virtual Channel	Specifies whether the sub-ring is operating with a virtual channel or not.
Data Traffic VLANs	A comma-separated list of configured VLAN-ids (individually, or range) that are used for data-traffic and protected by this ERP instance.
TCN To Inst	A comma-separated list of protocols and their instances that are to be notified when a Topology Change Notification occurs for this ERP instance. This only applies to a sub-ring with a Terminating interface and in which case "-" will be displayed if no target instances have been identified. Otherwise a "-" is displayed anyway. Identifies the protocol to notify. Only "G8032" will be supported initially. <instance-name> - Identifies the instance to notify for the given protocol.
TCN Flush Event	Specifies if this instance as a target instance is to send out Flush FDB messages upon TCN notifications by a detecting instance. Identifies the notifying protocol allowed. Only "G8032" will be supported initially. If no protocols have been configured then display "-".
SNMP Traps	Indicates whether SNMP traps have been enabled or disabled for this ERP instance.

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command. (cont.)

Parameter	Description
Signal Fail	Indicates whether a Signal Fail condition is being received over the East or West ring interface. <signal-fail> consists of: "-" no Signal Fail is being indicated "Link" - indicates the interface port or LAG has gone operationally down. "CFM MEP <mep-id>" - indicates that a local CFM MEP has indicated a Signal Fail, and which MEP by mep-id.
Failure of Protocol	Indicates that there are defects in the receipt of an R-APS message. There are the following types: FOP-PM (Provisioning Mismatch) - "true" indicates per G.8032, that the RPL-Owner is receiving R-APS(NR, RB) messages with a node-id not of itself. In addition, since the initial implementation does not support version 1, any R-APS messages with version 1 will also indicate a FOP-PM error. The FOP-PM error can occur on an East or a West Port. FOP-TO (Time Out) - "true" indicates that a node has not received an R-APS message on any of its ring ports for 3.5 times the R-APS message interval even though one or both ring ports are capable of receiving R-APS messages (no SF, Admin Up).
Version	The version of the R-APS message that is being received or sent over the East or West ring interface. An R-APS message version of "1" corresponds to G.8032 version 2.
Request	Indicates the protection switch request being sent or received in the R-APS message. Consists of one of: NR - No Request for protection switching SF - Signal Fail MS - Manual Switch request FS - Force Switch request Event - Request a Flush to be performed. Note this is a transient condition.
RPL Block	Indicates whether the RPL is being blocked or not. consists of one of the following: "RB" - RPL Block is being applied by the RPL-Owner. "-" - No RPL Block is being applied by the RPL-Owner, or the R-APS message originated from a non-RPL-Owner.
DNF	Indicates the value of the Do Not Flush bit in the R-APS message. The value is either "0" or "1".
Block Port Ref	Block Port Reference refers to the node's East or West port that is being blocked and shows as "0" or "1" in accordance to G.8032.
Node-ID	The MAC address of this Node or the MAC address used in sending/receiving R-APS messages.

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command. (cont.)

Parameter	Description
East Sending or West Sending	If this local node is not sending R-APS, then all the fields are shown as "-"
Timers	Wait-to-Restore - "Running" indicates this timer is active, otherwise is "-".Wait-to-Block - "Running" indicates this timer is active, otherwise is "-".Hold Off Timer - "Running" indicates this timer is active, otherwise is "-".

# show g8032 erp-instance statistics

**Overview** Use this command to show the G.8032 Ethernet Ring Protection (ERP) instance statistics.

**Syntax** `show g8032 erp-instance <erp-instance-name> statistics`

Parameter	Description
<code>&lt;erp-instance-name&gt;</code>	The name of a specific G.8032 ERP instance

**Mode** User Exec and Privileged Exec

**Example** To show the statistics for an ERP instance named "blue", use the following command:

```
awplus# show g8032 erp-instance blue statistics
```

**Output** Figure 60-4: Example output from the **show g8032 erp-instance statistics** command.

```
awplus#show g8032 erp-instance blue statistics

Instance Name : blue

```

**Table 2:** Parameters in the output from the **show g8032 erp-instance statistics** command

Parameter	Description
Instance Name	The configured <erp-instance-name> for this instance.
Local clear	The number of Clear commands invoked locally.
FOP-TO	The number of Failure of Protocol Time Out events seen locally.
RAPS NR	The number of R-APS messages with a No Request (NR) being received or sent.
RAPS NR-RB	The number of R-APS messages with a No Request, RPL Blocked (NR,RB) being received or sent.
RAPS SF	The number of R-APS messages with Signal Fail (SF) being received or sent.
RAPS FS	The number of R-APS messages with Forced Switch (FS) being received or sent.
RAPS MS	The number of R-APS messages with Manual Switch (MS) being received or sent.
RAPS Event	The number of R-APS messages with Event (Flush) being received or sent.
Drop Guard	The number of R-APS messages discarded due to Guard Timer.
Drop Error	The number of R-APS messages discarded due to incorrect MAC Address (unmatched Ring-ID), incorrect version, unusable Request/State, or other invalid code point in one of the message fields.
Local SF	The number of Signal Fail events seen locally.
FOP-PM	The number of Failure of Protocol events seen locally.

 Version 5.4.8-1.1: added to SBx908 GEN2 series products

# show g8032 physical-ring

**Overview** Use this command to show the G.8032 physical ring instance information.

**Syntax** `show g8032 physical-ring {<physical-ring-name>|all}`

Parameter	Description
<physical-ring-name>	The name of the physical ring
all	This shows all physical ring instances that have been configured

**Mode** User Exec and Privileged Exec

**Example** To show the details of a physical ring instance named "red", use the following command:

```
awplus# show g8032 physical-ring red
```

**Output** Figure 60-5: Example output from the **show g8032 physical-ring** command.

```
awplus#show g8032 physical-ring red
Ring : red
=====
East : port1.0.4
West : port1.0.8
ERP Inst : blue
```

**Table 3:** Parameters in the output from the **show g8032 physical-ring** command.

Parameter	Description
Ring	The name of the physical ring that was configured for this physical ring instance.
East, West, Terminating	The physical interface port or LAG of the East or West Ring interface, or the Terminating interface that was configured for this physical ring instance.
ERP Inst	A comma-separated list of ERP instances by name that have been configured to use this physical ring instance, or "-" if none.

**Related commands** [g8032 physical-ring](#)

**Command changes** Version 5.4.7-0.1: command added

Version 5.4.7-1.1: added to x310 series products

Version 5.4.7-2.1: added to x550 series products

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# show g8032 profile

**Overview** Use this command to show one specific G.8032 profile or all G.8032 profiles, and the configured information within each profile.

**Syntax** `show g8032 profile {<erp-profile-name>|default-profile|all}`

Parameter	Description
<code>&lt;erp-profile-name&gt;</code>	The name of the G.8032 profile that was created by the user.
<code>default-profile</code>	The default name of the G.8032 profile that was created automatically by the system.
<code>all</code>	Using this will show all G.8032 profiles.

**Mode** User Exec and Privileged Exec

**Example** To show the profile details for a profile named "prof1", use the following command:

```
awplus# show g8032 profile prof1
```

**Output** Figure 60-6: Example output from the **show g8032 profile** command.

```
awplus#show g8032 profile prof1
Profile : prof1
=====
Wait-To-Restore : 5 mins
Hold Off Timer : 0 ms
Guard Timer : 500 ms
Wait-To-Block : 5500 ms
Protection Type : Revertive
ERP Inst : blue
```

**Table 4:** Parameters in the output from **show g8032 profile** command.

Parameter	Description
Wait-To-Restore	The configured value in <1-12> minutes.
Hold Off Timer	The configured value but shown instead in milliseconds which ranges from 0 to 10,000 (10s) in 100 ms increments.
Guard Timer	The configured value which ranges from 10 to 2000 in 10 ms increments.

**Table 4:** Parameters in the output from **show g8032 profile** command. (cont.)

Parameter	Description
Wait-To-Block	5 seconds more than the configured Guard Time. The range is 5010 to 5200.
ERP Inst	Comma separated list of ERP instances using this profile, or "-" if there are none.

Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# sub-ring

**Overview** Use this command to configure the mode of operation for the G.8032 Ethernet Ring Protection (ERP) instance as a sub-ring.

Use the **no** variant of this command to change the mode of operation to that of a normal fully enclosed ring.

**Syntax** `sub-ring`  
`no sub-ring`

**Default** By default the mode is **no sub-ring**.

**Mode** G8032 Configure Switch

**Usage notes** An ERP instance can operate normally as a fully enclosed ring, commonly called a major ring, or as a partially enclosed ring, called a sub-ring. Sub-rings must be attached to either a major ring (one that is fully closed) or to other sub-rings where one of the other sub-rings itself is attached to a major ring.

Setting the mode to sub-ring should also be set for all nodes in the sub-ring, as the G.8032 state machine is different from that of a major ring.

This configuration can only be accepted when the ERP instance is disabled.

When the physical ring instance used by this ERP instance is configured for terminating interface, then this ERP instance will automatically be configured to be in the sub-ring mode and can not be changed.

**Example** To configure an ERP instance named "blue" as a sub-ring, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# sub-ring
```

**Related commands** [g8032 erp-instance](#)

Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# timer (g8032-profile)

**Overview** Use this command to configure a timer for a specified G.8032 Ethernet Ring Protection (ERP) instance profile.

**Syntax** `timer wait-to-restore {<1-12>|default}`  
`timer hold-off {<0-100>|default}`  
`timer guard-timer {<1-200>|default}`

Parameter	Description
<code>wait-to-restore</code>	This timer is used to soak signal failure abatement to ensure the signal failure abatement is not intermittent. This timer is only used by the RPL Owner when in the revertive operation, and thus is attempting to restore the ring. It is configurable in steps of 1 to 12 minutes (default is 5 minutes).
<code>hold-off</code>	This timer allows any other underlying protection schemes to recover before G.8032 reacts to its defect as this gives time for the G.8032 defect to clear. A classic example is when the ERP Physical ring port is carried over a SONET/SDH transmission system that itself has 50ms recovery times. If G.8032 detects a failure, then increasing this timer to some value greater than 50ms would allow the SONET/SDH system to recover and have the defect that G.8032 detected disappear thus preventing the need for G.8032 to try and recover. The Hold Off timer is configurable in 0 to 10 seconds in steps of 100ms (default is 0 ms).
<code>guard-timer</code>	This is the amount of time that an ERP instance discards most R-APS messages before being allowed to process them. It is used when a clearing condition occurs yet at the same time older messages are still propagating around the ring with failure indications. For example two nodes that just noticed a link failure abatement condition could start clearing and almost immediately one of them could receive an old Signal Fail indication message from the other node (that was still in flight) which in turn causes the receiving node to react to the Signal Fail inadvertently. This timer is particularly useful where R-APS propagation time through the ring is large. Refer to ITU-T G.8032 for more information. The Guard timer is configurable in 10ms steps between 10ms and 2 seconds (default is 50 for 500ms).

**Mode** G8032 Profile Configuration

**Example** To set the wait-to-restore timer of a profile named "prof\_1" to a value of 1 minute, use the following commands:

```
awplus(config)# g8032 profile prof_1
awplus(g8032-profile-config)# timer wait-to-restore 1
```

**Related commands** [g8032 profile](#)  
[show g8032 profile](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products

Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# topology-change

**Overview** Use this command to enable this G.8032 Ethernet Ring Protection (ERP) instance to send a Flush Event message after notification of a Topology Change Notification (TCN) by a detecting instance.

Use the **no** variant of this command to disable the sending of the Flush Event.

**Syntax** topology-change {g8032}  
no topology-change {g8032}

Parameter	Description
g8032	Specify that G.8032 is the protocol that is affected by this command.

**Default** Topology change is enabled by default for G.8032.

**Mode** G8032 Configure Switch

**Usage notes** If this ERP instance is on an interconnecting node, then the ERP instance may need to be notified of a topology change that occurred in another G.8032 sub-ring attached to this node. The former will be termed the "target" ERP instance, and the latter the "detecting" ERP instance.

The criteria for notification is:

- the detecting ERP instance is configured as a sub-ring with a Terminating interface,
- it is protecting the same data VLANs as the target instance, and
- the target ERP instance must have two ring ports.

When the detecting ERP instance detects a topology change on its sub-ring, AlliedWare Plus™ will automatically determine which target ERP instance(s) needs to be notified. It does this by comparing the same data VLANs in the detecting ERP instance with all the other instances.

If target ERP instances are identified and these instances also have both an East and a West interface configured, then those target instances are notified. Upon notification, the target ERP instance has a couple of actions that it has to perform:

- To flush the FDB on both its East and West interfaces for the protected VLANs.
- To send out an R-APS flush event message over its East and West interfaces. The flush event message is sent around the target ring and each node on the target ring will perform an FDB flush of its protected VLANs. The sending of a R-APS flush event may not be needed in some cases and as such it is configurable.

**Example** To enable sending of R-APS flush event messages on an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# topology-change g8032
```

**Related commands** [g8032 erp-instance](#)

# trap (g8032-switch)

**Overview** Use this command to enable or disable SNMP traps for a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** trap {enabled|disabled}

Parameter	Description
enabled	Enable this ERP instance to generate traps.
disabled	Disable this ERP instance from generating traps.

**Default** The SNMP traps for the ERP instance are enabled.

**Mode** G8032 Configure Switch

**Usage notes** Globally, ERP traps are disabled by default but can be enabled globally using the [snmp-server enable trap](#) command.

**Example** To disable the SNMP traps for an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# trap disabled
```

**Related commands** [erp-instance](#)  
[show g8032 erp-instance](#)

Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# undebug g8032

**Overview** Use this command to turn off debugging for various G.8032 debug attributes.

**Syntax** `undebug g8032 {all|event|rx|tx}`

Parameter	Description
all	All G.8032 debugging
event	G.8032 debugging events
rx	G.8032 debugging Receive activities
tx	G.8032 debugging Transmit activities

**Mode** Privileged Exec

**Example** To turn off all G.8032 debugging, use the following command:

```
awplus# undebug g8032 all
```

**Related commands** [debug g8032](#)  
[show debugging g8032](#)

# Media Redundancy Protocol (MRP) Commands

## Introduction

**Overview** This chapter provides an alphabetical list of Media Redundancy Protocol (MRP) commands.

For more information, see the [MRP Feature Overview and Configuration Guide](#).

- Command List**
- ["clear counter mrp"](#) on page 3057
  - ["debug mrp"](#) on page 3058
  - ["domain-id \(mrp-ring\)"](#) on page 3059
  - ["domain-name \(mrp-ring\)"](#) on page 3060
  - ["enable \(mrp-ring\)"](#) on page 3061
  - ["lc-react"](#) on page 3062
  - ["mrp ring"](#) on page 3063
  - ["profile \(mrp-ring\)"](#) on page 3065
  - ["role \(mrp-ring\)"](#) on page 3066
  - ["service mrp"](#) on page 3067
  - ["show counter mrp"](#) on page 3068
  - ["show debugging mrp"](#) on page 3072
  - ["show mrp ports"](#) on page 3073
  - ["show mrp ring"](#) on page 3074
  - ["vlan-id \(mrp-ring\)"](#) on page 3076

# clear counter mrp

**Overview** Use this command to clear the MRP counters.

**Syntax** `clear counter mrp [global|ring <ring-id>]`

Parameter	Description
global	Clear only global MRP counters.
ring	Clear only MRP counters for a specific MRP ring.
<ring-id>	<1-65535>. The ID of an MRP ring.

**Mode** Privileged Exec

**Example** To clear all MRP counters, use the command:

```
awplus# clear counter mrp
```

To clear only the global MRP counters, use the command:

```
awplus# clear counter mrp global
```

To clear all MRP counters for MRP ring 1, use the command:

```
awplus# clear counter mrp ring 1
```

**Related commands** [mrp ring](#)  
[show counter mrp](#)

**Command changes** Version 5.5.0-2.1: command added

# debug mrp

**Overview** Use this command to enable debug output for MRP.  
Use the **no** variant of this command to disable debug output.

**Syntax** `debug mrp {all|fdb|fsm|port}`  
`no debug mrp {all|fdb|fsm|port}`

Parameter	Description
all	Enable all debug output options for MRP.
fdb	Enable debug output for MRP forwarding database events.
fsm	Enable debug output for MRP state machine events.
port	Enable debug output for MRP port events.

**Default** All MRP debug output is disabled.

**Mode** User Exec

**Usage notes** Note that enabling MRP debug is not saved to the config, so enabling debug output will not be persistent.

**Example** To enable all MRP debug output, use the command:

```
awplus# debug mrp all
```

To disable MRP port event debug output, use the command:

```
awplus# no debug mrp port
```

**Related commands** [mrp ring](#)  
[show debugging mrp](#)

**Command changes** Version 5.5.0-2.1: command added

# domain-id (mrp-ring)

**Overview** Use this command to configure the domain ID of an MRP ring. The domain ID is used to identify the nodes in the ring, and is set in the MRP PDU packets. All nodes in an MRP ring must have the same domain ID.

Use the **no** variant of this command to reset the domain ID to the default.

**Syntax** domain-id <uuid>  
no domain-id <uuid>

Parameter	Description
<uuid>	A hexadecimal string that identifies the MRP ring, with a format like FFFFFFFF-FFFF-FFFF-FFFF-FFFFFFFFFFFFFF.

**Default** A hexadecimal string, with the value:  
FFFFFFFF-FFFF-FFFF-FFFF-FFFFFFFFFFFFFF - <Ring ID> + 1

**Mode** MRP Ring Configuration

**Example** To configure the domain ID of MRP ring 1 to FFFFFFFF-FFFF-FFFF-FFFF-FFFFFFFF3210, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# domain-id
FFFFFFFF-FFFF-FFFF-FFFF-FFFFFFFF3210
```

**Related commands**

- [domain-name \(mrp-ring\)](#)
- [enable \(mrp-ring\)](#)
- [mrp ring](#)
- [profile \(mrp-ring\)](#)
- [role \(mrp-ring\)](#)
- [vlan-id \(mrp-ring\)](#)

**Command changes** Version 5.5.0-2.1: command added

# domain-name (mrp-ring)

**Overview** Use this command to set the domain name of an MRP ring.  
Use the **no** variant of this command to remove the domain name of an MRP ring.

**Syntax** domain-name <name>  
no domain-name

Parameter	Description
<name>	The domain name for the MRP ring.

**Default** No domain name is set.

**Mode** MRP Ring Configuration

**Example** To set the domain name of MRP ring 1 to 'ring1', use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# domain-name ring1
```

To clear the domain name of MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# no domain-name
```

**Related commands**

- [domain-id \(mrp-ring\)](#)
- [enable \(mrp-ring\)](#)
- [mrp ring](#)
- [profile \(mrp-ring\)](#)
- [role \(mrp-ring\)](#)
- [vlan-id \(mrp-ring\)](#)

**Command changes** Version 5.5.0-2.1: command added

# enable (mrp-ring)

**Overview** Use this command to enable MRP on an MRP ring.  
Use the **no** variant of this command to disable MRP on an MRP ring.

**Syntax** enable  
no enable

**Default** MRP is enabled.

**Mode** MRP Ring Configuration

**Example** To disable MRP for MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# no enable
```

**Related commands** [domain-id \(mrp-ring\)](#)  
[domain-name \(mrp-ring\)](#)  
[mrp ring](#)  
[profile \(mrp-ring\)](#)  
[role \(mrp-ring\)](#)  
[vlan-id \(mrp-ring\)](#)

**Command changes** Version 5.5.0-2.1: command added

# lc-react

**Overview** Use this command to configure the media redundancy manager (MRM) to react to MRP\_LinkDown and MRP\_LinkUp frames from media redundancy clients (MRCs). This may result in faster failover and recovery time.

Use the **no** variant of this command to set the MRM back to the default of ignoring those packets, and relying on the test frame interval timeout.

**Syntax** `lc-react`  
`no lc-react`

**Default** The MRM ignores MRP\_LinkDown and MRP\_LinkUp frames from MRCs, and relies on the test frame interval timeout.

**Mode** MRP Ring Manager Configuration

**Example** To configure MRP ring 1 to react to MRP\_LinkDown and MRP\_LinkUp frames, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# role manager
awplus(config-mrp-ring-manager)# lc-react
```

To reset MRP ring 1 to ignore MRP\_LinkDown and MRP\_LinkUp frames, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# role manager
awplus(config-mrp-ring-manager)# no lc-react
```

**Related commands** [mrp ring](#)  
[role \(mrp-ring\)](#)

**Command changes** Version 5.5.0-2.1: command added

# mrp ring

**Overview** Use this command to create an MRP Ring and enter MRP Ring Configuration mode, or to attach a port to an MRP ring.

In Global Configuration mode, this command will create an MRP ring and enter MRP Ring Configuration mode.

In Interface Configuration mode, this command will attach a port to an MRP ring. The MRP ring registers the port's VLAN in the MRP structure. If this is the second port to be attached to the MRP ring, it will first verify that the VLANs match.

Use the **no** variant of this command to remove a port from an MRP ring.

**Syntax** `mrp ring <ring-id>`  
`no mrp ring <ring-id>`

Parameter	Description
<code>&lt;ring-id&gt;</code>	<1-65535>. The ID of the MRP ring.

**Mode** Global Configuration mode to enter MRP Ring Configuration mode, or Interface Configuration mode to attach a port to or remove a port from an MRP ring.

**Example** To create MRP ring 1 and enter MRP Ring Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)#
```

To attach port1.0.1 to MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# mrp ring 1
```

To remove port1.0.1 from MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no mrp ring 1
```

**Related commands**

- [domain-id \(mrp-ring\)](#)
- [domain-name \(mrp-ring\)](#)
- [enable \(mrp-ring\)](#)
- [profile \(mrp-ring\)](#)
- [role \(mrp-ring\)](#)
- [vlan-id \(mrp-ring\)](#)

**Command changes** Version 5.5.0-2.1: command added

# profile (mrp-ring)

**Overview** Use this command to set the maximum recovery timing profile for an MRP ring. This sets the worst case recovery time to 200ms or 500ms.

Use the **no** variant of this command to return to the default value (200ms).

**Syntax** `profile {200|500}`  
`no profile`

Parameter	Description
200	The worst-case recovery time is set to 200ms.
500	The worst-case recovery time is set to 500ms.

**Default** 200ms.

**Mode** MRP Ring Configuration

**Example** To configure the worst case recovery time for MRP ring 1 to 500ms, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# profile 500
```

To reset the worst case recovery time for MRP ring 1 to the default of 200ms, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# no profile
```

**Related commands**

- [domain-id \(mrp-ring\)](#)
- [domain-name \(mrp-ring\)](#)
- [enable \(mrp-ring\)](#)
- [mrp ring](#)
- [role \(mrp-ring\)](#)
- [vlan-id \(mrp-ring\)](#)

**Command changes** Version 5.5.0-2.1: command added

# role (mrp-ring)

**Overview** Use this command to set the operating role for a node in an MRP ring. If the node is set to 'manager', it will also set the mode to MRP Ring Manager Configuration mode.

Use the **no** variant of this command to set the operating role to the default (client).

**Syntax** `role {client|manager}`  
`no role {client|manager}`

Parameter	Description
client	Assigns the operating role of media redundancy client (MRC) to the node.
manager	Assigns the operating role of media redundancy manager (MRM) to the node.

**Default** Client.

**Mode** MRP Ring Configuration

**Example** To assign the manager role to a node on MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# role manager
awplus(config-mrp-ring-manager)#
```

To set the role of a node on MRP ring 1 to the default (client), use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# no role
```

**Related commands** [lc-react](#)  
[mrp ring](#)

**Command changes** Version 5.5.0-2.1: command added

# service mrp

**Overview** Use this command to enable the Media Redundancy Protocol (MRP) service. This is required before any other MRP configuration can be entered. To start the MRP service, the MRP feature must be licensed.

Use the **no** variant of this command to disable the MRP service.

**Syntax** `service mrp`  
`no service mrp`

**Default** The MRP service is disabled.

**Mode** Global Configuration

**Example** To enable the MRP service, use the commands:

```
awplus# configure terminal
awplus(config)# service mrp
```

To disable the MRP service, use the commands:

```
awplus# configure terminal
awplus(config)# no service mrp
```

**Related commands** [mrp ring](#)

**Command changes** Version 5.5.0-2.1: command added

# show counter mrp

**Overview** Use this command to show the MRP counters.

The global counters provide an overall count of protocol packets being sent and received, as well as the timer and dispatcher that show the service has not halted.

The ring counters provide per-ring counters for both ring ports. These count the different types of MRP PDU packets that are sent and received. They also provide topology and port state counters that record events on the ring.

**Syntax** `show counter mrp [global|ring <ring-id>]`

Parameter	Description
global	Show only global MRP counters.
ring	Show only MRP counters for a specific MRP ring.
<ring-id>	<1-65535>. The ID of an MRP ring.

**Mode** User Exec

**Example** To show all MRP counters, use the command:

```
awplus# show counter mrp
```

To show only the global MRP counters, use the command:

```
awplus# show counter mrp global
```

To show all MRP counters for MRP ring 1, use the command:

```
awplus# show counter mrp ring 1
```

Table 61-1: Parameters in the output from **show counter mrp**

Parameter	Description
MRP Started	The number of times the MRP service has been started with the service mrp command. This counter increases each time it is stopped and started.
MRP Dispatcher MRP Timer Tick	Internal timer tick that provides timing for the protocol and the dispatcher. This is called to process timing events, packet reception, and state changes.
MRP Packet RX	The number of MRP protocol packets received.
MRP Packet RX Error	The number of failures when receiving a packet.
MRP Packet TX	The number of MRP protocol packets sent.
MRP Packet TX Error	The number of failures when sending a packet.
MRP_Test	The number of test frames sent and received by the Media Redundancy Manager (MRM) to test if the ring is open or closed.
MRP_TopologyChange	The number of topology change frames sent from the MRM to indicate ring topology changes to Media Redundancy Clients (MRC).
MRP_LinkUp MRP_LinkDown	The number of Link Up/Down frames sent from MRC to indicate a link state change on one of its ring ports.
State Changes	The number of changes in the protocol state. These are triggered by test packets detecting the ring opening or closing, and MRP ring port link changes.
Port Blocked Set	The number of times a ring port has been set to blocking.

Table 61-1: Parameters in the output from **show counter mrp** (cont.)

Parameter	Description
Port Forwarding Set	The number of times a ring port has been set to forwarding.
Multiple Manager	A misconfiguration detected by the MRM that another manager is on the ring. This is detected from information in the MRP PDU frames.

**Related commands** [clear counter mrp](#)  
[mrp ring](#)

**Command changes** Version 5.5.0-2.1: command added

# show debugging mrp

**Overview** Use this command to show which debug options are enabled for MRP logging.

**Syntax** `show debugging mrp`

**Mode** User Exec

**Example** To show the enabled MRP debugging options, use the command:

```
awplus# show debugging mrp
```

**Output** Figure 61-4: Example output from **show debugging mrp**

```
awplus#show debugging mrp
MRP debugging status:
 MRP Port debugging: On
 MRP FSM debugging: Off
 MRP FDB debugging: Off
```

Table 61-2: Parameters in the output from **show debugging mrp**

Parameter	Description
MRP Port debugging	Debug output for MRP port events.
MRP FSM debugging	Debug output for MRP state machine events.
MRP FDB debugging	Debug output for MRP forwarding database events.

**Related commands** [debug mrp](#)  
[mrp ring](#)

**Command changes** Version 5.5.0-2.1: command added

# show mrp ports

**Overview** Use this command to show a summary of all ports that are configured for MRP rings.

**Syntax** `show mrp ports`

**Mode** User Exec

**Example** To show a summary of the ports configured for MRP rings, use the command:

```
awplus# show mrp ports
```

**Output** Figure 61-5: Example output from **show mrp ports**

```
awplus#show mrp ports
Media Redundancy Protocol - Port Information

Connection Port State

Ring 1 port1.0.23 Blocking
Ring 1 port1.0.24 Forwarding
```

Table 61-3: Parameters in the output from **show mrp ports**

Parameter	Description
Connection	The name of the MRP ring.
Port	The ID of the port.
State	The state of the port: Disabled - all packets received by the port are dropped. Blocking - all packets received by the port are dropped, with the exception of MRP protocol packets. Forwarding - all packets received by the port are forwarded.

**Related commands** [mrp ring](#)

**Command changes** Version 5.5.0-2.1: command added

# show mrp ring

**Overview** Use this command to show the MRP ring settings for a specific ring, or for all rings.

**Syntax** show mrp ring [*<ring-id>*]

Parameter	Description
<i>&lt;ring-id&gt;</i>	The ID of an MRP ring.

**Mode** Privileged Exec

**Example** To show the settings for all MRP rings, use the command:

```
awplus# show mrp ring
```

To show the settings for MRP ring 1, use the command:

```
awplus# show mrp ring 1
```

**Output** Figure 61-6: Example output from **show mrp ring**

```
awplus#show mrp ring
Media Redundancy Protocol - Ring Information
MRP Ring 1
 Domain ID: ffffffff-ffff-ffff-ffff-ffffffffffff
 Domain Name:
 Ring Status: Enabled
 Operating Mode: CLI
 Role: Manager
 Network Status: Open
 Port1: port1.0.25
 Status: Forwarding
 Port2: port1.0.29
 Status: Forwarding
 Vlan ID:
 React on Link Change: No
 Profile: 200ms
 Topology Change Interval: 10ms
 Topology Change Count: 3
 Short Test Frame Interval: 10ms
 Default Test Frame Interval: 20ms
 Test Monitoring Interval Count: 3
 Test Monitoring Ext Interval Count: 0
 Non-blocking MRC Supported: No
```

Table 61-4: Parameters in the output from **show mrp ring**

Parameter	Description
Domain ID	The UUID that identifies the ring. The Domain ID is used in MRP PDU packets.
Domain Name	Description of the ring that can be set by the user.
Ring Status	Whether the ring is Enabled or Disabled.
Operating Mode	CLI - the MRP ring is configured and controlled from the command line.
Role	Whether the node is a Manager (MRM) or Client (MRC).
Network Status	Whether the MRP ring is Open or Closed (MRM only).
Port Status	The state of the port: Disabled - all packets received by the port are dropped. Blocking - all packets received by the port are dropped, with the exception of MRP protocol packets. Forwarding - all packets received by the port are forwarded.
Vlan ID	If the MRP ring is configured with a trunked VLAN, this shows the configured VLAN ID.
Profile	Whether it is configured for 200ms or 500ms.

**Related commands** [mrp ring](#)

**Command changes** Version 5.5.0-2.1: command added

# vlan-id (mrp-ring)

**Overview** Use this command to assign a VLAN to an MRP ring.

**Syntax** `vlan-id <vlan>`

Parameter	Description
<code>&lt;vlan&gt;</code>	<code>&lt;1-4094&gt;</code> The ID of the VLAN to be assigned.

**Mode** MRP Ring Configuration

**Usage notes** This is only possible if the ports attached to the MRP ring are set to trunked mode. In access mode, MRP will automatically set this to the VLAN of the port.  
Both ports must be in the same VLAN.

**Example** To assign VLAN 2 to MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# vlan-id 2
```

# Part 7: Network Management

# 62

# Allied Telesis Management Framework™ (AMF) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for Allied Telesis Management Framework™ (AMF) commands.

**AMF master nodes** Every AMF network must have at least one master node, which acts as the core of the AMF network. Not all AlliedWare Plus devices are capable of acting as an AMF master. See the [AMF Feature Overview and Configuration Guide](#) for information about AMF master support.

**AMF edge** AlliedWare Plus CentreCOM® Series switches can only be used as edge switches in an AMF network. The full management power and convenience of AMF is available on these switches, but they can only link to one other AMF node. They cannot form cross-links or virtual links.

**AMF naming convention** When AMF is enabled on a device, it will automatically be assigned a host name. If a host name has already been assigned, by using the command [hostname](#) on page 302, this will remain. If however, no host name has been assigned, then the name applied will be the prefix, **host\_** followed (without a space) by the MAC address of the device. For example, a device whose MAC address is **0016.76b1.7a5e** will have the name **host\_0016\_76b1\_7a5e** assigned to it.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network devices, and apply an appropriate hostname to each device in your AMF network.

**AMF and STP** On AR-Series UTM firewalls and Secure VPN routers, you cannot use STP at the same time as AMF.

# application-proxy ip-filter

**Overview** Use this command to enable global IP filtering on a device. Once enabled the device will add a global ACL in response to a threat message from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable global IP filtering.

**Syntax** `application-proxy ip-filter`  
`no application-proxy ip-filter`

**Default** Global IP filtering is disabled by default.

**Mode** Global Configuration

**Usage notes** For this feature to work, the AMF Application Proxy service needs to be enabled on your network, using the command `service atmf-application-proxy`.

**Example** To enable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy ip-filter
```

To disable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy ip-filter
```

**Related commands** `application-proxy redirect-url`  
`application-proxy threat-protection`  
`clear application-proxy threat-protection`  
`service atmf-application-proxy`  
`show application-proxy threat-protection`

**Command changes** Version 5.4.7-2.5: command added

# application-proxy quarantine-vlan

**Overview** Use this command to set the quarantine VLAN to use when an AMF Security (AMF-Sec) Controller detects a threat. The port/s on which the threat is detected are moved to this VLAN if the [application-proxy threat-protection](#) action is set to **quarantine**.

Use the **no** variant of this command to delete the quarantine VLAN. If no quarantine VLAN is specified then no quarantine action will be performed.

**Syntax** `application-proxy quarantine-vlan <vlan-id>`  
`no application-proxy quarantine-vlan`

Parameter	Description
<code>&lt;vlan-id&gt;</code>	The ID of the VLAN to use. In the range 1-4094.

**Default** By default, no quarantine VLAN is configured.

**Mode** Global Configuration

**Example** To configure VLAN 100 as the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy quarantine-vlan 100
```

To delete the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy quarantine-vlan
```

**Related commands** [application-proxy threat-protection](#)  
[clear application-proxy threat-protection](#)  
[application-proxy threat-protection send-summary](#)  
[service atmf-application-proxy](#)  
[show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# application-proxy redirect-url

**Overview** Use this command to redirect a user to a helpful URL when they are blocked because of an [application-proxy ip-filter](#).

Use the **no** variant of this command to remove the URL redirect.

**Syntax** `application-proxy redirect-url <url>`  
`no application-proxy redirect-url`

Parameter	Description
<code>&lt;url&gt;</code>	URL to redirect the user to.

**Default** No URL is configured by default.

**Mode** Global Configuration

**Example** To configure a redirect URL, use the command:

```
awplus# application-proxy redirect-url http://my.dom/help.html
```

To remove a redirect URL, use the command:

```
awplus# no application-proxy redirect-url
```

**Related commands** [application-proxy ip-filter](#)  
[application-proxy threat-protection](#)  
[clear application-proxy threat-protection](#)  
[service atmf-application-proxy](#)  
[show application-proxy threat-protection](#)

**Command changes** Version 5.4.9-0.1: command added

# application-proxy threat-protection

**Overview** Use this command to set the blocking action to take when a threat detected message is received from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable threat protection blocking actions on the port.

**Syntax** application-proxy threat-protection {drop|link-down|  
quarantine|log-only}  
no application-proxy threat-protection

Parameter	Description
drop	Apply a Layer 2 drop for traffic generating the threat reports.
link-down	Set the link to error disabled in response to threats.
quarantine	Move the offending port to a quarantine VLAN.
log-only	Log when a threat is detected.

**Default** Threat protection is disabled by default.

**Mode** Interface Configuration

**Example** To set the threat protection blocking action on port1.0.4 to drop, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy threat-protection drop
```

To disable threat protection blocking actions on port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy threat-protection
```

**Related commands**

- [application-proxy quarantine-vlan](#)
- [application-proxy threat-protection send-summary](#)
- [clear application-proxy threat-protection](#)
- [service atmf-application-proxy](#)
- [show application-proxy threat-protection](#)

**Command changes**

- Version 5.4.7-2.2: command added
- Version 5.4.9-0.1: **log-only** parameter added

# application-proxy threat-protection send-summary

**Overview** Use this command to send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes. This command can only be performed on an AMF master.

**Syntax** `application-proxy threat-protection send-summary`

**Mode** Privileged Exec

**Example** To send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes, use the command:

```
awplus# application-proxy threat-protection send-summary
```

**Related commands**

- [application-proxy quarantine-vlan](#)
- [application-proxy threat-protection](#)
- [clear application-proxy threat-protection](#)
- [service atmf-application-proxy](#)
- [show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# application-proxy whitelist advertised-address

**Overview** Use this command to register a Layer 3 interface, and the IPv4 address that is attached to this interface, as the advertised application-proxy whitelist address for a device.

Use the **no** variant of this command to stop advertising the Layer 3 interface and its associated IPv4 address.

**Syntax** `application-proxy whitelist advertised-address <interface>`  
`no application-proxy whitelist advertised-address`

Parameter	Description
<code>&lt;interface&gt;</code>	Layer 3 interface to configure as the advertised address.

**Default** No address advertised by default.

**Mode** Global Configuration

**Example** To configure the IPv4 address attached to VLAN 1 as the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist advertised-address
vlan1
```

To remove the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist
advertised-address
```

**Related commands** [application-proxy whitelist server](#)  
[show application-proxy whitelist advertised-address](#)

**Command changes** Version 5.4.9-1.1: command added

# application-proxy whitelist enable

**Overview** Use this command to enable application-proxy whitelist based authentication on an interface.

Use the **no** variant of this command to disable the whitelist authentication.

**Syntax** application-proxy whitelist enable  
no application-proxy whitelist enable

**Default** Application-proxy whitelist is disabled by default.

**Mode** Interface Configuration

**Usage notes** When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Example** To enable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy whitelist enable
```

To disable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy whitelist enable
```

**Related commands** application-proxy whitelist server  
show application-proxy whitelist interface  
show application-proxy whitelist server  
show application-proxy whitelist supplicant

**Command changes** Version 5.4.9-0.1: command added

# application-proxy whitelist protection tls

**Overview** Use this command to configure the application-proxy whitelist control channel to use TLS protection. If no trustpoint is specified then TLS will operate without authentication.

Use the **no** variant of this command to stop using TLS.

**Syntax** `application-proxy whitelist protection tls [trustpoint <name>]`  
`no application-proxy whitelist protection tls`

Parameter	Description
<code>trustpoint</code>	Specify an optional trustpoint. If no trustpoint is specified then TLS will operate without authentication.
<code>&lt;name&gt;</code>	Name of the trustpoint.

**Default** TLS is disabled by default.

**Mode** Global Configuration

**Example** To configure an AMF application-proxy whitelist to use TLS with the trustpoint 'corpca', use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist protection tls
trustpoint corpca
```

To configure an AMF application-proxy whitelist to stop using TLS, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist protection tls
```

**Related commands** [application-proxy whitelist enable](#)  
[application-proxy whitelist server](#)  
[show application-proxy whitelist server](#)

**Command changes** Version 5.5.0-2.1: command added

# application-proxy whitelist server

**Overview** Use this command to set an AMF master to act as a whitelist authentication proxy between AMF members, acting as Network Access Servers, and an external whitelist RADIUS server.

Use the **no** variant of this command to disable the whitelist proxy functionality.

**Syntax** `application-proxy whitelist server <ip-address> key <key>`  
`[auth-port <1-65535>]`  
`no application-proxy whitelist server`

Parameter	Description
<code>&lt;ip-address&gt;</code>	IPv4 address of the upstream RADIUS server in dotted decimal format A.B.C.D.
<code>key &lt;key&gt;</code>	Set the shared secret encryption key for communication with the upstream RADIUS server.
<code>auth-port &lt;1-65535&gt;</code>	Set the RADIUS server UDP port. This is only necessary if you don't want to use the default port 1812.

**Default** Disabled by default.

**Mode** Global Configuration

**Example** To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on port 1822, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey auth-port 1822
```

To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on the default port (1812), use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey
```

To disable the whitelist proxy, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist server
```

**Related commands**

- [show application-proxy whitelist interface](#)
- [show application-proxy whitelist server](#)

show application-proxy whitelist supplicant

**Command changes** Version 5.4.9-0.1: command added

# application-proxy whitelist trustpoint (deprecated)

**Overview** This command has been deprecated. It has been replaced by the [application-proxy whitelist protection tls](#) command.

This command sets the trustpoint to use when communicating with the external whitelist RADIUS server. This enables RADIUS over TLS (RadSec) protection.

**Syntax** `application-proxy whitelist trustpoint <name>`  
`no application-proxy whitelist trustpoint`

**Command changes** Version 5.4.9-1.1: command added  
Version 5.5.0-2.1: command deprecated

# area-link

**Overview** Use this command to create an area-link between a Virtual AMF Appliance (VAA) host controller and an AMF container.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an area-link from a container.

**Syntax** `area-link <area-name>`  
`no area-link`

Parameter	Description
<code>&lt;area-name&gt;</code>	AMF area name of the container's area.

**Mode** AMF Container Configuration

**Usage notes** The AMF area-link connects the AMF controller on a VAA host to the AMF container. Once a container has been created with the [atmf container](#) command and an area-link configured with the **area-link** command, it can be enabled using the [state](#) command.

You can only configure a single area-link on a container. You will see the following message if you try and configure a second one:

```
% AreaLink already configured for this container
```

Each container has two virtual interfaces:

- Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, configured using this area-link command.
- Interface eth1, used to connect to the outside world using a bridged L2 network link, configured using the [bridge-group](#) command.

See the [AMF Feature Overview and Configuration\\_Guide](#) for more information on these virtual interfaces and links.

**Example** To create the area-link to "wlg" on container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# area-link wlg
```

To remove an area-link from container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no area-link
```

**Related  
commands**

[atmf container](#)  
[show atmf container](#)

**Command  
changes**

Version 5.4.7-0.1: command added

# atmf-arealink

**Overview** This command to enable an Eth interface, on an AR-series device, as an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network. This command is only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF area links that may exist for the selected Eth interface.

**Syntax** `atmf-arealink remote-area <area-name> vlan <2-4094>`  
`no atmf-arealink`

Parameter	Description
<area-name>	The name of the remote area that the interface is connecting to.
<2-4094>	The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link.

**Default** By default, no area links are configured

**Mode** Eth interface on an AR-series device.

**Usage notes** Run this command on the interface at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will synchronize the area information stored on the two nodes.

You can configure multiple area links between two area nodes, but only one area link at any time will be in use. All other area links will block information, to prevent network storms.

**NOTE:** See the [switchport atmf-arealink](#) command to configure an AMF area link on an a switch port or link aggregator

**Example** To configure eth1 as an AMF area link to the 'Auckland' area on VLAN 6, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# atmf-arealink remote-area Auckland vlan 6
```

To remove eth1 as an AMF area link, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# no atmf-arealink
```

- Related commands**
- atmf area
  - atmf area password
  - atmf virtual-link
  - show atmf links
- Command changes**
- Version 5.5.0-1.1: command added

# atmf-link

**Overview** Use this command to enable an Eth interface on an AR-series device as an up/down AMF link. This command is only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF link that may exist for the selected Eth interface.

**Syntax** `atmf-link`  
`no atmf-link`

**Mode** Eth interface on an AR-series device.

**Usage notes** Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

If you run the command and AMF secure mode is not enabled, you will see the following error message:

```
Node_1(config)#int eth1
Node_1(config-if)#atmf-link
% Cannot configure eth1 because atmf secure-mode is not enabled.
```

**NOTE:** See the [switchport atmf-link](#) command to configure an AMF up/down link on an a switch port or link aggregator

**Example** To configure eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# atmf-link
```

To remove eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# no atmf-link
```

**Related commands** [atmf recover over-eth](#)  
[atmf secure-mode](#)  
[show atmf detail](#)  
[show atmf links](#)  
[switchport atmf-link](#)

**Command changes** Version 5.5.0-1.1: command added

# atmf area

**Overview** This command creates an AMF area and gives it a name and ID number. Use the **no** variant of this command to remove the AMF area. This command is only valid on AMF controllers, master nodes and gateway nodes.

**Syntax** `atmf area <area-name> id <1-126> [local]`  
`no atmf area <area-name>`

Parameter	Description
<area-name>	The AMF area name. The area name can be up to 15 characters long. Valid characters are: a..z A..Z 0..9 - _ Names are case sensitive and must be unique within an AMF network. The name cannot be the word "local" or an abbreviation of the word "local" (such as "l", "lo" etc.).
<1-126>	An ID number that uniquely identifies this area.
local	Set the area to be the local area. The local area contains the device you are configuring.

**Mode** Global Configuration

**Usage notes** This command enables you to divide your AMF network into areas. Each area is managed by at least one AMF master node. Each area can have up to 120 nodes, depending on the license installed on that area's master node.

The whole AMF network is managed by up to 8 AMF controllers. Each AMF controller can communicate with multiple areas. The number of areas supported on a controller depends on the license installed on that controller.

You must give each area in an AMF network a unique name and ID number.

Only one local area can be configured on a device. You must specify a local area on each controller, remote AMF master, and gateway node.

**Example** To create the AMF area named *New-Zealand*, with an ID of 1, and specify that it is the local area, use the command:

```
controller-1(config)# atmf area New-Zealand id 1 local
```

To configure a remote area named *Auckland*, with an ID of 100, use the command:

```
controller-1(config)# atmf area Auckland id 100
```

**Related commands**

- atmf area password
- show atmf area
- show atmf area summary
- show atmf area nodes
- switchport atmf-arealink

# atmf area password

**Overview** This command sets a password on an AMF area.

Use the **no** variant of this command to remove the password.

This command is only valid on AMF controllers, master nodes and gateway nodes. The area name must have been configured first.

**Syntax** `atmf area <area-name> password [8] <password>`  
`no atmf area <area-name> password`

Parameter	Description
<area-name>	The AMF area name.
8	This parameter is displayed in <b>show running-config</b> output to indicate that it is displaying the password in encrypted form. You should not enter <b>8</b> on the CLI yourself.
<password>	The password is between 8 and 32 characters long. It can include spaces.

**Mode** Global Configuration

**Usage notes** You must configure a password on each area that an AMF controller communicates with, except for the controller's local area. The areas must already have been created using the `atmf area` command.

Enter the password identically on both of:

- the area that locally contains the controller, and
- the remote AMF area masters

The command **show running-config atmf** will display the encrypted version of this password. The encryption keys will match between the controller and the remote AMF master.

If multiple controller and masters exist in an area, they must all have the same area configuration.

**Example** To give the AMF area named *Auckland* a password of "secure#1" use the following command on the controller:

```
controller-1(config)# atmf area Auckland password secure#1
```

and also use the following command on the master node for the Auckland area:

```
auck-master(config)# atmf area Auckland password secure#1
```

**Related  
commands**

- atmf area
- show atmf area
- show atmf area summary
- show atmf area nodes
- switchport atmf-arealink

# atmf authorize

**Overview** On an AMF network, with secure mode enabled, use this command on an AMF master to authorize an AMF node to join the network. AMF nodes waiting to be authorized appear in the pending authorization queue, which can be examined using the [show atmf authorization](#) command with the **pending** parameter.

Use the **no** variant of this command to revoke authorization for an AMF node on an AMF master.

**Syntax** `atmf authorize {<node-name> [area <area-name>]|all-pending}`  
`no atmf authorize <node-name> [area <area-name>]`

Parameter	Description
<node-name>	The name of the node to be authorized or have its authorization revoked.
area	Specify an AMF area.
<area-name>	This is the name of the area the node belongs to.
all-pending	Authorize all nodes in the pending queue.

**Mode** Privileged Exec

**Usage notes** On an AMF controller, AMF remote-area masters must be authorized by the controller, and the AMF remote-area masters will also need to authorized access from the AMF controller.

**Example** To authorize all AMF nodes in the pending authorization queue on an AMF master, use the command:

```
awplus# atmf authorize all-pending
```

To authorize a node called "node2" in remote AMF area "area3", use the command:

```
awplus# atmf authorize node2 area "area3"
```

To authorize a node called "node4" on an AMF master, use the command:

```
awplus# atmf authorize node4
```

To revoke authorization for a node called "node4" on an AMF master, use the command:

```
awplus# no atmf authorize node4
```

**Related commands**

- [atmf secure-mode](#)
- [clear atmf secure-mode certificates](#)
- [show atmf authorization](#)
- [show atmf secure-mode](#)

show atmf secure-mode certificates

show atmf secure-mode statistics

**Command changes** Version 5.4.7-0.3: command added

# atmf authorize provision

**Overview** Use this command from an AMF controller or AMF master to pre-authorize a node on an AMF network running in secure mode. This allows a node to join the AMF network the moment the `atmf secure-mode` command is run on that node.

Use the **no** variant of this command to remove a provisional authorization from and AMF controller or AMF master.

**Syntax**

```
atmf authorize provision [timeout <minutes>] node <node-name>
interface <interface-name> [area <area-name>]

atmf authorize provision [timeout <minutes>] mac <mac-address>

atmf authorize provision [timeout <minutes>] all

no atmf authorize provision node <node-name> interface
<interface-name> [area <area-name>]

no atmf authorize provision mac <mac-address>

no atmf authorize provision all
```

Parameter	Description
timeout	Timeout for provisional authorization. Authorization for provisioned nodes expires after the timeout period specified.
<minutes>	Timeout in minutes. A value between 1 and 6000 is permissible with the default being 60 minutes.
node	Specify a node to provision by node name.
<node-name>	The name of the node to provisionally authorize.
interface	Specify the interface the node will connect on.
<interface-name>	The name of the interface, this can be a switchport, link aggregator, LACP link, or virtual link.
area	Specify the AMF area.
<area-name>	This is the name of the area the node belongs to.
mac	Specify a node to provision by MAC address.
<mac-address>	Enter a MAC address to provisionally authorize in the format HHHH.HHHH.HHHH.
all	Provision authorization for all secure mode capable nodes.

**Default** The default timeout is 60 minutes.

**Mode** Privileged Exec

**Example** To provisionally authorize all non-secure AMF nodes, use the command:

```
awplus# atmf authorize provision all
```

To authorize a node with a MAC address of 0000.cd28.0880 for 2 hours, use the command:

```
awplus# authorize provision timeout 120 mac 0000.cd28.0880
```

To remove all provisional authorization, on an AMF master, use the command:

```
awplus# no atmf authorize provision all
```

**Related commands**

- [show atmf authorization](#)
- [show atmf secure-mode](#)

**Command changes**

- Version 5.4.7-0.3: command added

# atmf backup

**Overview** This command can only be applied to a master node. It manually schedules an AMF backup to start at a specified time and to execute a specified number of times per day.

Use the **no** variant of this command to disable the schedule.

**Syntax** `atmf backup {default|<hh:mm> frequency <1-24>}`

Parameter	Description
default	Restore the default backup schedule.
<hh:mm>	Sets the time of day to apply the first backup, in hours and minutes. Note that this parameter uses the 24 hour clock.
backup	Enables AMF backup to external media.
frequency <1-24>	Sets the number of times within a 24 hour period that backups will be taken.

**Default** Backups run daily at 03:00 AM, by default

**Mode** Global Configuration

**Usage notes** Running this command only configures the schedule. To enable the schedule, you should then apply the command [atmf backup enable](#).

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To schedule backup requests to begin at 11 am and execute twice per day (11 am and 11 pm), use the following command:

```
node_1# configure terminal
node_1(config)# atmf backup 11:00 frequency 2
```

**CAUTION:** File names that comprise identical text, but with differing case, such as *Test.txt* and *test.txt*, will not be recognized as being different on FAT32 based backup media such as a USB storage device. However, these filenames will be recognized as being different on your Linux based device. Therefore, for good practice, ensure that you apply a consistent case structure for your back-up file names.

**Related commands** [atmf backup enable](#)  
[atmf backup stop](#)  
[show atmf backup](#)

# atmf backup area-masters delete

**Overview** Use this command to delete from external media, a backup of a specified node in a specified area.

Note that this command can only be run on an AMF controller.

**Syntax** `atmf backup area-masters delete area <area-name> node <node-name>`

Parameter	Description
<code>&lt;area-name&gt;</code>	The area that contains the node whose backup will be deleted.
<code>&lt;node-name&gt;</code>	The node whose backup will be deleted.

**Mode** Privileged Exec

**Example** To delete the backup of the remote area-master named “well-gate” in the AMF area named Wellington, use the command:

```
controller-1# atmf backup area-masters delete area Wellington
node well-gate
```

**Related commands** [show atmf backup area](#)

# atmf backup area-masters enable

**Overview** Use this command to enable backup of remote area-masters from the AMF controller. This command is only valid on AMF controllers.

Use the **no** form of the command to stop backups of remote area-masters.

**Syntax** `atmf backup area-masters enable`  
`no atmf backup area-masters enable`

**Mode** Global configuration

**Default** Remote area backups are disabled by default

**Usage notes** Use the following commands to configure the remote area-master backups:

- [atmf backup](#) to configure when the backups begin and how often they run
- [atmf backup server](#) to configure the backup server.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To enable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf backup area-masters enable
```

To disable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf backup area-masters enable
```

**Related commands** [atmf backup server](#)  
[atmf backup](#)  
[show atmf backup area](#)

# atmf backup area-masters now

**Overview** Use this command to run an AMF backup of one or more remote area-masters from the AMF controller immediately.

This command is only valid on AMF controllers.

**Syntax** `atmf backup area-masters now [area <area-name>|area <area-name>  
node <node-name>]`

Parameter	Description
<area-name>	The area whose area-masters will be backed up.
<node-name>	The node that will be backed up.

**Mode** Privileged Exec

**Example** To back up all local master nodes in all areas controlled by controller-1, use the command

```
controller-1# atmf backup area-masters now
```

To back up all local masters in the AMF area named Wellington, use the command

```
controller-1# atmf backup area-masters now area Wellington
```

To back up the local master "well-master" in the Wellington area, use the command

```
controller-1# atmf backup area-masters now area Wellington node
well-master
```

**Related commands** [atmf backup area-masters enable](#)  
[atmf backup area-masters synchronize](#)  
[show atmf backup area](#)

# atmf backup area-masters synchronize

**Overview** Use this command to synchronize backed-up area-master files between the active remote file server and the backup remote file server. Files are copied from the active server to the remote server.

Note that this command is only valid on AMF controllers.

**Syntax** `atmf backup area-masters synchronize`

**Mode** Privileged Exec

**Example** To synchronize backed-up files between the remote file servers for all area-masters, use the command:

```
controller-1# atmf backup area-masters synchronize
```

**Related commands**

- [atmf backup area-masters enable](#)
- [atmf backup area-masters now](#)
- [show atmf backup area](#)

# atmf backup bandwidth

**Overview** This command sets the maximum bandwidth in kilobytes per second (kBps) available to the AMF backup process. This command enables you to restrict the bandwidth that is utilized for downloading file contents during a backup.

**NOTE:** *This command will only run on an AMF master. An error message will be generated if the command is attempted on node that is not a master.*

*Also note that setting the bandwidth value to zero will allow the transmission of as much bandwidth as is available, which can exceed the maximum configurable speed of 1000 kBps. In effect, zero means unlimited.*

Use the **no** variant of this command to reset (to its default value of zero) the maximum bandwidth in kilobytes per second (kBps) available when initiating an AMF backup. A value of zero tells the backup process to transfer files using unlimited bandwidth.

**Syntax** `atmf backup bandwidth <0-1000>`  
`no atmf backup bandwidth`

Parameter	Description
<code>&lt;0-1000&gt;</code>	Sets the bandwidth in kilobytes per second (kBps)

**Default** The default value is zero, allowing unlimited bandwidth when executing an AMF backup.

**Mode** Global Configuration

**Examples** To set an atmf backup bandwidth of 750 kBps, use the commands:

```
node2# configure terminal
node2(config)# atmf backup bandwidth 750
```

To set the AMF backup bandwidth to the default value for unlimited bandwidth, use the commands:

```
node2# configure terminal
node2(config)# no atmf backup bandwidth
```

**Related commands** [show atmf backup](#)

# atmf backup delete

**Overview** This command removes the backup file from the external media of a specified AMF node.

Note that this command can only be run from an AMF master node.

**Syntax** `atmf backup delete <node-name>`

Parameter	Description
<code>&lt;node-name&gt;</code>	The AMF node name of the backup file to be deleted.

**Mode** Privileged Exec

**Example** To delete the backup file from node2, use the following command:

```
Node_1# atmf backup delete node2
```

**Related commands**

- `show atmf backup`
- `atmf backup now`
- `atmf backup stop`

# atmf backup enable

**Overview** This command enables automatic AMF backups on the AMF master node that you are connected to. By default, automatic backup starts at 3:00 AM. However, this schedule can be changed by the [atmf backup](#) command. Note that backups are initiated and stored only on the master nodes.

Use the **no** variant of this command to disable any AMF backups that have been scheduled and previously enabled.

**Syntax** `atmf backup enable`  
`no atmf backup enable`

**Default** Automatic AMF backup functionality is enabled on the AMF master when it is configured and external media, i.e. an SD card or a USB storage device or remote server, is detected.

**Mode** Global Configuration

**Usage notes** A warning message will appear if you run the [atmf backup enable](#) command with either insufficient or marginal memory availability on your external storage device.

You can use the command [show atmf backup](#) on page 3257 to check the amount of space available on your external storage device.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To turn on automatic AMF backup, use the following command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup enable
```

**Related commands** [show atmf](#)  
[show atmf backup](#)  
[atmf backup](#)  
[atmf backup now](#)  
[atmf enable](#)

# atmf backup guests delete

**Overview** This command removes a guest node's backup files from external media such as a USB drive, SD card, or an external file server.

**Syntax** `atmf backup guests delete <node-name> <guest-port>`

Parameter	Description
<code>&lt;node-name&gt;</code>	The name of the guest's parent node.
<code>&lt;guest-port&gt;</code>	The port number on the parent node.

**Mode** User Exec/Privileged Exec

**Example** On a parent node named "node1" (which, in this case, the user has a direct console connection to) use the following command to remove the backup files of the guest node that is directly connected to port1.0.3.

```
node1# atmf backup guests delete node1 port1.0.3
```

**Related Command**

- [atmf backup delete](#)
- [atmf backup area-masters delete](#)
- [show atmf backup guest](#)

# atmf backup guests enable

**Overview** Use this command to enable backups of remote guest nodes from an AMF master. Use the **no** variant of this command to disable the ability of the guest nodes to be backed up.

**Syntax** `atmf backup guests enable`  
`no atmf backup guests enable`

**Default** Guest node backups are enabled by default.

**Mode** Global Config

**Usage notes** We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** On the AMF master node, enable all scheduled guest node backups:

```
atmf-master# configure terminal
atmf-master(config)# atmf backup guests enable
```

**Related commands** [atmf backup area-masters enable](#)  
[show atmf backup guest](#)  
[atmf backup guests synchronize](#)

# atmf backup guests now

**Overview** This command manually triggers an AMF backup of guest nodes on a AMF Master.

**Syntax** `atmf backup guests now [<node-name>] [<guest-port>]`

Parameter	Description
<code>&lt;node-name&gt;</code>	The name of the guest's parent node.
<code>&lt;guest-port&gt;</code>	The port number that connects to the guest node.

**Default** n/a

**Mode** Privileged Exec

**Example** Use the following command to manually trigger the backup of all guests in the AMF network

```
awplus# atmf backup guests now
```

**Example** To manually trigger the backup of a guest node connected to port 1.0.23 of node1, use the following command:

```
awplus# atmf backup guests now node1 port1.0.23
```

**Related commands** [show atmf backup guest](#)

# atmf backup guests synchronize

**Overview** This command initiates a manual synchronization of all guest backup file-sets across remote file servers and various redundancy backup media, such as USB storage devices. This facility ensures that each device contains the same backup image files. Note that this backup synchronization process will occur as part of the regular backups scheduled by the [atmf backup](#) command.

**Syntax** `atmf backup guests synchronize`

**Default** n/a

**Mode** User Exec/Privileged Exec

**Example** To synchronize backups across remote file servers and storage devices, use the command:

```
Node1#atmf backup guests synchronize
```

**Related commands** [atmf backup redundancy enable](#)  
[show atmf guests](#)  
[atmf backup guests enable](#)

# atmf backup now

**Overview** This command initiates an immediate AMF backup of either all AMF members, or a selected AMF member. Note that this backup information is stored in the external media on the master node of the device on which this command is run, even though the selected AMF member may not be a master node.

Note that this command can only be run on an AMF master node.

**Syntax** `atmf backup now [<nodename>]`

Parameter	Description
<nodename> or <hostname>	The name of the AMF member to be backed up, as set by the command <code>hostname</code> on page 302. Where no name has been assigned to this device, then you must use the default name, which is the word "host", then an underscore, then (without a space) the MAC address of the device to be backed up. For example <code>host_0016_76b1_7a5e</code> . Note that the node-name appears as the command Prompt when in Privileged Exec mode.

**Default** A backup is initiated for all nodes on the AMF (but stored on the master nodes).

**Mode** Privileged Exec

**Usage notes** Although this command will select the AMF node to be backed-up, it can only be run from any AMF master node.

**NOTE:** *The backup produced will be for the selected node but the backed-up config will reside on the external media of the AMF master node on which the command was run. However, this process will result in the information on one master being more up-to-date. To maintain concurrent backups on both masters, you can apply the backup now command to the master working-set. This is shown in Example 4 below.*

**Example 1** In this example, an AMF member has not been assigned a host name. The following command is run on the AMF\_Master\_2 node to immediately backup the device that is identified by its MAC address of 0016.76b1.7a5e:

```
AMF_Master_2# atmf backup now host_0016_76b1_7a5e
```

**NOTE:** *When a host name is derived from its MAC address, the syntax format entered changes from XXXX.XXXX.XXXX to XXXX\_XXXX\_XXXX.*

**Example 2** In this example, an AMF member has the host name, **office\_annex**. The following command will immediately backup this device:

```
AMF_Master_2# atmf backup now office_annex
```

This command is initiated on the device's master node named **AMF\_Master\_2** and initiates an immediate backup on the device named **office\_annex**.

**Example 3** To initiate from AMF\_master\_1 an immediate backup of all AMF member nodes, use the following command:

```
AMF_Master_1# amf backup now
```

**Example 4** To initiate an immediate backup of the node with the host-name “office\_annex” and store the configuration on both masters, use the following process:

From the AMF\_master\_1, set the working-set to comprise only of the automatic group, master nodes.

```
AMF_Master_1# atmf working-set group master
```

This command returns the following display:

```
=====
AMF_Master_1, AMF_Master_2
=====

Working set join
```

Backup the AMF member with the host name, **office\_annex** on both the master nodes as defined by the working set.

```
AMF_Master[2]# atmf backup now office_annex
```

Note that the [2] shown in the command prompt indicates a 2 node working-set.

**Related commands**

- [atmf backup](#)
- [atmf backup stop](#)
- [hostname](#)
- [show atmf backup](#)

# atmf backup redundancy enable

**Overview** This command is used to enable or disable AMF backup redundancy.

**Syntax** `atmf backup redundancy enable`  
`no atmf backup redundancy enable`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** If the AMF Master or Controller supports any removable media (SD card/USB), it uses the removable media as the redundant backup for the AMF data backup.

This feature is valid only if remote file servers are configured on the AMF Master or Controller.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To enable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# atmf backup redundancy enable
```

To disable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf backup redundancy enable
```

**Related commands** [atmf backup synchronize](#)  
[show atmf backup](#)  
[show atmf backup area](#)

# atmf backup server

**Overview** This command configures remote file servers as the destination for AMF backups.

Use the **no** variant of this command to remove the destination server(s). When all servers are removed the system will revert to backup from external media.

**Syntax** `atmf backup server id {1|2} <hostlocation> username <username>  
[path <path>|port <1-65535>]`  
`no atmf backup server id {1|2}`

Parameter	Description
id	Remote server backup server identifier.
{1 2}	The backup server identifier number (1 or 2). Note that there can be up to two backup servers, numbered 1 and 2 respectively, and you would need to run this command separately for each server.
<hostlocation>	Either the name or the IP address (IPv4 or IPv6) of the selected backup server (1 or 2).
username	Configure the username to log in with on the selected remote file server.
<username>	The selected remote file server's username.
path	The location of the backup files on the selected remote file server. By default this will be the home directory of the username used to log in with.
<path>	The directory path utilized to store the backup files on the selected remote file server. No spaces are allowed in the path.
port	The connection to the selected remote backup file server using SSH. By default SSH connects to a device on TCP port 22 but this can be changed with this command.
<1-65535>	A TCP port within the specified range.

**Defaults** Remote backup servers are not configured. The default SSH TCP port is 22. The path utilized on the remote file server is the home directory of the username.

**Mode** Global Exec

**Usage notes** The hostname and username parameters must both be configured.

**Examples** To configure server 1 with an IPv4 address and a username of *backup1*, use the commands:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 192.168.1.1
username backup1
```

To configure server 1 with an IPv6 address and a username of *backup1*, use the command:

```
AMF_backup1_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 FFEE::01 username
backup1
```

To configure server 2 with a hostname and username, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com
username backup2
```

To configure server 2 with a hostname and username in addition to the optional path and port parameters, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com
username backup2 path tokyo port 1024
```

To unconfigure the AMF remote backup file server 1, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# no atmf backup server id 1
```

**Related commands** [show atmf backup](#)

# atmf backup stop

**Overview** Running this command stops a backup that is currently running on the master node you are logged onto. Note that if you have two masters and want to stop both, then you can either run this command separately on each master node, or add both masters to a working set, and issue this command to the working set.

Note that this command can only be run on a master node.

**Syntax** `atmf backup stop`

**Mode** Privileged Exec

**Usage notes** This command is used to halt an AMF backup that is in progress. In this situation the backup process will finish on its current node and then stop.

**Example** To stop a backup that is currently executing on master node node-1, use the following command:

```
AMF_Master_1# amf backup stop
```

**Related commands**

- [atmf backup](#)
- [atmf backup enable](#)
- [atmf backup now](#)
- [show atmf backup](#)

# atmf backup synchronize

**Overview** For the master node you are connected to, this command initiates a system backup of files from the node's active remote file server to its backup remote file server. Note that this process happens automatically each time the network is backed up.

Note that this command can only be run from a master node.

**Syntax** `atmf backup synchronize`

**Mode** Privileged Exec

**Example** When connected to the master node `AMF_Master_1`, the following command will initiate a backup of all system related files from its active remote file server to its backup remote file server.

```
AMF_Master_1# atmf backup synchronize
```

# atmf cleanup

**Overview** This command is an alias to the [erase factory-default](#) command.

# atmf container

**Overview** Use this command to create or update an AMF container on a Virtual AMF Appliance (VAA) virtual machine.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an AMF container.

**Syntax** `atmf container <container-name>`  
`no atmf container <container-name>`

Parameter	Description
<code>&lt;container-name&gt;</code>	The name of the AMF container to create, update, or remove.

**Mode** AMF Container Configuration

**Usage notes** You cannot delete a container while it is still running. First use the **state disable** command to stop the container.

**Examples** To create or update the AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)#
```

To remove the AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# no atmf container vac-wlg-1
```

**Related commands**

- [atmf container login](#)
- [bridge-group](#)
- [description \(amf-container\)](#)
- [show atmf container](#)
- [state](#)

**Command changes** Version 5.4.7-0.1: command added

# atmf container login

**Overview** Use this command to login to an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `atmf container login <container-name>`

Parameter	Description
<code>&lt;container-name&gt;</code>	The name of the AMF container you wish to login into.

**Mode** Privileged Exec

**Usage notes** If you try to login to a AMF container that has not been created, or is not running, you will see the following message:

```
% Container does not exist or is not running.
```

To exit from a container and return to the host VAA press `<Ctrl+a q>`.

**Example** To login to container “vac-wlg-1”, use the command:

```
awplus# atmf container login vac-wlg-1
```

You will then be presented with a login screen for that container:

```
Connected to tty 1
Type <Ctrl+a q> to exit the console, <Ctrl+a Ctrl+a> to enter Ctrl+a itself

vac-wlg-1 login: manager
Password: friend

AlliedWare Plus (TM) 5.4.7 02/03/17 08:46:12

vac-wlg-1>
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# atmf controller

**Overview** Use this command to configure the device as an AMF controller. This enables you to split a large AMF network into multiple areas.

AMF controller is a licensed feature. The number of areas supported on a controller depends on the license installed on that controller.

Use the **no** variant of this command to remove the AMF controller functionality.

**Syntax** `atmf controller`  
`no atmf controller`

**Mode** Global configuration

**Usage notes** If a valid AMF controller license is not available on the device, the device will accept this command but will not act as a controller until you install a valid license. The following message will warn you of this:

“An AMF Controller license must be installed before this feature will become active”

**NOTE:** *If the AMF controller functionality is removed from a device using the **no atmf controller** command then the device must be rebooted if it is to function properly as an AMF master.*

**Example** To configure the node named *controller-1* as an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf controller
```

To stop the node named *controller-1* from being an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf controller
```

**Related commands** [atmf area](#)  
[show atmf](#)

# atmf distribute firmware

**Overview** This command can be used to upgrade software one AMF node at a time. A URL can be selected from any media location. The latest compatible release for a node will be selected from this location.

Several procedures are performed to ensure the upgrade will succeed. This includes checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash on the new location.

The new release name is updated using the **boot system** command. The old release will become the backup release file. If a release file exists in a remote device (such as TFTP or HTTP, for example) then the URL should specify the exact release filename without using a wild card character.

The command will continue to upgrade software until all nodes are upgraded. At the end of the upgrade cycle the command should be used on the working-set.

**Syntax** `atmf distribute firmware <filename>`

Parameter	Description
<code>&lt;filename&gt;</code>	The filename and path of the file. See the <a href="#">File Management Feature Overview and Configuration Guide</a> for valid syntax.

**Mode** Privileged Exec

**Examples** To upgrade nodes in a AMF network with a predefined AMF group called 'teams', use the following command:

```
Team1# atmf working-set group teams
```

```
=====
Team1, Team2, Team3:
=====
Working set join
```

```
ATMF_NETWORK[3]# atmf distribute firmware card:*.rel
```

```
Retrieving data from Team1
Retrieving data from Team2
Retrieving data from Team3

ATMF Firmware Upgrade:

Node Name New Release File Status

Team1 x510-5.4.7-1.1.rel Release ready
Team2 x930-5.4.7-1.1.rel Release ready
Team3 x930-5.4.7-1.1.rel Release ready
Continue the rolling reboot ? (y/n):y
=====
Copying Release : x510-5.4.7-1.1.rel to Team1
Updating Release : x510-5.4.7-1.1.rel information on Team1
=====
Copying Release : x930-5.4.7-1.1.rel to Team2
Updating Release : x930-5.4.7-1.1.rel information on Team2
=====
Copying Release : x930-5.4.7-1.1.rel to Team3
Updating Release : x930-5.4.7-1.1.rel information on Team3
=====
New firmware will not take effect until nodes are rebooted.
=====

ATMF_NETWORK[3]#
```

**Related commands** [atmf working-set](#)

# atmf domain vlan

**Overview** The AMF domain VLAN is created when the AMF network is first initiated and is assigned a default VID of 4091. This command enables you to change the VID from this default value on this device.

The AMF domain VLAN is one of AMF's internal VLANs (the management VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

An important point conceptually is that although the domain VLAN exists globally across the AMF network, it is assigned separately to each domain. The AMF network therefore can be thought of as comprising a series of domain VLANs each having the same VID and each being applied to a horizontal slice (domain) of the AMF. It follows therefore that the domain VLANs are only applied to ports that form cross-links and not to ports that form uplinks/downlinks.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to reset the VLAN ID to its default value of 4091.

**Syntax** `atmf domain vlan <2-4090>`  
`no atmf domain vlan`

Parameter	Description
<code>&lt;2-4090&gt;</code>	The VLAN number in the range 2 to 4090.

**Default** VLAN 4091

**Mode** Global Configuration

**Usage notes** We recommend you only change the domain VLAN when first creating the AMF network, and only if VLAN 4091 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
```

```
test(config)[10]# atmf domain vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

- 4) Create the working set again, using the commands:

```
master(config)# exit
```

```
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

**NOTE:** The domain VLAN will automatically be assigned an IP subnet address based on the value configured by the command *atmf management subnet*.

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

**Examples** To change the AMF domain VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
```

```
test[10]# configure terminal
```

```
test(config)[10]# atmf domain vlan 4090
```

```
master(config)# exit
```

```
master# atmf working-set group all
```

```
test[10]# write
```

To reset the AMF domain VLAN to its default of 4091 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf domain vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands** [atmf management subnet](#)  
[atmf management vlan](#)

# atmf enable

**Overview** This command manually enables (turns on) the AMF feature for the device being configured.

Use the **no** variant of this command to disable (turn off) the AMF feature on the member node.

**Syntax** atmf enable  
no atmf enable

**Default** Once AMF is configured, the AMF feature starts automatically when the device starts up.

**Mode** Global Configuration

**Usage notes** The device does not auto negotiate AMF domain specific settings such as the Network Name. You should therefore, configure your device with any domain specific (non default) settings before enabling AMF.

**Examples** To turn off AMF, use the command:

```
MyNode# config terminal
MyNode(config)# no atmf enable
```

To turn on AMF, use the command:

```
MyNode(config)# atmf enable
```

This command returns the following display:

```
% Warning: The ATMF network config has been set to enable
% Save the config and restart the system for this change to take
effect.
```

# atmf group (membership)

**Overview** This command configures a device to be a member of one or more AMF groups. Groups exist in three forms: Implicit Groups, Automatic Groups, and User-defined Groups.

- Implicit Groups
  - all: All nodes in the AMF
  - current: The current working-set
  - local: The originating node.

Note that the Implicit Groups do not appear in show group output.

- Automatic Groups - These are defined by hardware architecture, e.g. x510, x230, x8100, AR3050S, AR4050S.
- User-defined Groups - These enable you to define arbitrary groups of AMF members based on your own criteria.

Each node in the AMF is automatically assigned membership to the implicit groups, and the automatic groups that are appropriate to its node type, e.g. x230, PoE. Similarly, nodes that are configured as masters are automatically assigned to the master group.

Use the **no** variant of this command to remove the membership.

**Syntax** `atmf group <group-list>`  
`no atmf group <group-list>`

Parameter	Description
<code>&lt;group-list&gt;</code>	A list of group names. These should be entered as a comma delimited list without spaces. Names can contain alphanumeric characters, hyphens and underscores.

**Mode** Global Configuration

**Usage notes** You can use this command to define your own arbitrary groups of AMF members based on your own network's configuration requirements. Applying a node to a non existing group will result in the group automatically being created.

Note that the master nodes are automatically assigned to be members of the pre-existing master group.

The following example configures the device to be members of three groups; two are company departments, and one comprises all devices located in building\_2. To avoid having to run this command separately on each device that is to be added to these groups, you can remotely assign all of these devices to a working-set, then use the capabilities of the working-set to apply the [atmf group \(membership\)](#) command to all members of the working set.

**Example 1** To specify the device to become a member of AMF groups named *marketing*, *sales*, and *building\_2*, use the following commands:

```
node-1# configure terminal
node-1(config)# atmf group marketing,sales,building_2
```

**Example 2** To add the nodes *member\_node\_1* and *member\_node\_2* to groups *building1* and *sales*, first add the nodes to the working-set:

```
master_node# atmf working-set member_node_1,member_node_2
```

This command returns the following output confirming that the nodes *member\_node\_1* and *member\_node\_2* are now part of the working-set:

```
=====
member_node_1, member_node_2
=====

Working set join
```

Then add the members of the working set to the groups:

```
atmf-net[2]# configure terminal
atmf-net[2](config)# atmf group building1,sales
atmf-net[2](config)# exit
atmf-net[2]# show atmf group
```

This command returns the following output displaying the groups that are members of the working-set.

```
=====
member_node_1
=====

AMF group information

building1, sales
```

**Related commands** [show atmf group](#)  
[show atmf group members](#)

# atmf guest-class

**Overview** This modal command creates a guest-class. Guest-classes are modal templates that can be applied to selected guest types. Once you have created a guest-class, you can select it by entering its mode. From here, you can then configure a further set of operational settings specifically for the new guest-class.

These settings can then all be applied to a guest link by running the [switchport atmf-guestlink](#) command. The following settings can be configured from each guest class mode:

- discovery method
- model type
- http-enable setting
- guest port, user name, and password

The **no** variant of this command removes the guest-class. Note that you cannot remove a guest-class that is assigned to a port.

**Syntax** `atmf guest-class <guest-class-name>`  
`no atmf guest-class <guest-class-name>`

Parameter	Description
<code>&lt;guest-class-name&gt;</code>	The name assigned to the guest-class type. This can be chosen from an arbitrary string of up to 15 characters.

**Mode** Global Configuration

**Example** To create a guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class camera
node1(config-atmf-guest)#
```

To remove the guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# no atmf guest-class camera
```

login-fallback enable

# atmf log-verbose

**Overview** This command limits the number of log messages displayed on the console or permanently logged.

Use the **no** variant of this command to reset to the default.

**Syntax** atmf log-verbose <1-3>  
no atmf log-verbose

Parameter	Description
<1-3>	The verbose limitation (3 = noisiest, 1 = quietest)

**Default** The default log display is 3.

**Usage** This command is intended for use in large networks where verbose output can make the console unusable for periods of time while nodes are joining and leaving.

**Mode** Global Configuration

**Example** To set the log-verbose to noise level 2, use the command:

```
node-1# configure terminal
node-1(config)# atmf log-verbose 2
```

**Validation Command** `show atmf`

# atmf management subnet

**Overview** This command is used to assign a subnet that will be allocated to the AMF management and domain management VLANs. From the address space defined by this command, two subnets are created, a management subnet component and a domain component, as explained in the Usage section below.

AMF uses these internal IPv4 subnets to communicate network status information between nodes. These subnet addresses must be reserved for AMF and not used for other purposes.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to remove the assigned subnet.

**Syntax** atmf management subnet <a.b.0.0>  
no atmf management subnet

Parameter	Description
<a.b.0.0>	The IP address selected for the management subnet. Because a mask of 255.255.0.0 (i.e. /16) will be applied automatically, an IP address in the format a.b.0.0 must be selected. Usually this subnet address is selected from an appropriate range from within the private address space of 172.16.0.0 to 172.31.255.255, or 192.168.0.0, as defined in RFC1918.

**Default** 172.31.0.0. A subnet mask of 255.255.0.0 will automatically be applied.

**Mode** Global Configuration

**Usage notes** Running this command will result in the creation of a further two subnets (within the class B address space assigned) and the mask will extend from /16 to /17.

For example, if the management subnet is assigned the address 172.31.0.0/16, this will result in the automatic creation of the following two subnets:

- 172.31.0.0/17 assigned to the [atmf management vlan](#)
- 172.31.128.0/17 assigned to the [atmf domain vlan](#).

We recommend you only change the management subnet when first creating the AMF network, and only if 172.31.0.0 is already being used in your network.

However, if you do need to change the subnet on an existing AMF network, use the following steps:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN, management VLAN, or management subnet. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new subnet address, using the commands:

```
test[10]# configure terminal
```

```
test(config)[10]# atmf management subnet <a.b.0.0>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new subnet.

- 4) Create the working set again, using the commands:

```
master(config)# exit
```

```
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the subnet on missing devices by logging into their consoles directly.

**Examples** To change the AMF management subnet address to 172.25.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
```

```
test[10]# configure terminal
```

```
test(config)[10]# atmf management subnet 172.25.0.0
```

```
master(config)# exit
```

```
master# atmf working-set group all
```

```
test[10]# write
```

To reset the AMF management subnet address to its default of 172.31.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management subnet
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands**

- [atmf domain vlan](#)
- [atmf management vlan](#)

# atmf management vlan

**Overview** The AMF management VLAN is created when the AMF network is first initiated and is assigned a default VID of 4092. This command enables you to change the VID from this default value on this device.

The AMF management VLAN is one of AMF's internal VLANs (the domain VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to restore the VID to the default of 4092.

**Syntax** atmf management vlan <2-4090>  
no atmf management vlan

Parameter	Description
<2-4090>	The VID assigned to the AMF management VLAN.

**Default** VLAN 4092

**Mode** Global Configuration

**Usage notes** We recommend you only change the management VLAN when first creating the AMF network, and only if VLAN 4092 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps to ensure you change it on all nodes simultaneously:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the management VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
test(config)[10]# atmf management vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

- 4) Create the working set again, using the commands:

```
master(config)# exit
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

**NOTE:** The management VLAN will automatically be assigned an IP subnet address based on the value configured by the command [atmf management subnet](#).

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

**Examples** To change the AMF management VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf management vlan 4090
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF management VLAN to its default of 4092 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands** [atmf domain vlan](#)  
[atmf management subnet](#)

# atmf master

**Overview** This command configures the device to be an AMF master node and automatically creates an AMF master group. The master node is considered to be the core of the AMF network, and must be present for the AMF to form. The AMF master has its node depth set to 0. Note that the node depth vertical distance is determined by the number of uplinks/downlinks that exist between the node and its master.

An AMF master node must be present for an AMF network to form. Up to two AMF master nodes may exist in a network, and they **must** be connected by an AMF crosslink.

**NOTE:** Master nodes are an essential component of an AMF network. In order to run AMF, an AMF License is required for each master node.

If the crosslink between two AMF masters fails, then one of the masters will become isolated from the rest of the AMF network.

Use the **no** variant of this command to remove the device as an AMF master node. The node will retain its node depth of 0 until the network is rebooted.

**NOTE:** Node depth is the vertical distance (or level) from the master node (whose depth value is 0).

**Syntax** atmf master  
no atmf master

**Default** The device is not configured to be an AMF master node.

**Mode** Global Configuration

**Example** To specify that this node is an AMF master, use the following command:

```
node-1# configure terminal
node-1(config)# atmf master
```

**Related commands** [show atmf](#)  
[show atmf group](#)

# atmf mtu

**Overview** This command configures the AMF network Maximum Transmission Unit (MTU). The MTU value will be applied to the AMF Management VLAN, the AMF Domain VLAN and AMF Area links.

Use the **no** variant of this command to restore the default MTU.

**Syntax** `atmf mtu <1300-1442>`  
`no atmf mtu`

Parameter	Description
<1300-1442>	The value of the maximum transmission unit for the AMF network, which sets the maximum size of all AMF packets generated from the device.

**Default** 1300

**Mode** Global Configuration

**Usage notes** The default value of 1300 will work for all AMF networks (including those that involve virtual links over IPsec tunnels). If there are virtual links over IPsec tunnels anywhere in the AMF network, we recommend not changing this default. If there are no virtual links over IPsec tunnels, then this AMF MTU value may be increased for network efficiency.

**Example** To change the ATMF network MTU to 1442, use the command:

```
awplus(config)# atmf mtu 1442
```

**Related commands** [show atmf detail](#)

# atmf network-name

**Overview** This command applies an AMF network name to a (prospective) AMF node. In order for an AMF network to be valid, its network-name must be configured on at least two nodes, one of which must be configured as a master and have an AMF License applied. These nodes may be connected using either AMF downlinks or crosslinks.

For more information on configuring an AMF master node, see the command [atmf master](#).

Use the **no** variant of this command to remove the AMF network name.

**Syntax** `atmf network-name <name>`  
`no atmf network-name`

Parameter	Description
<code>&lt;name&gt;</code>	The AMF network name. Up to 15 printable characters can be entered for the network-name.

**Mode** Global Configuration

**Usage notes** This is one of the essential commands when configuring AMF and must be entered on each node that is to be part of the AMF.

A switching node (master or member) may be a member of only one AMF network.

**CAUTION:** *Ensure that you enter the correct network name. Entering an incorrect name will cause the AMF network to fragment (at the next reboot).*

**Example** To set the AMF network name to `amf_net` use the command:

```
Node_1(config)# atmf network-name amf_net
```

# atmf provision (interface)

**Overview** This command configures a specified port on an AMF node to accept a provisioned node, via an AMF link, some time in the future.

Use the **no** variant of this command to remove the provisioning on the node.

**Syntax** `atmf provision <nodename>`  
`no atmf provision`

Parameter	Description
<code>&lt;nodename&gt;</code>	The name of the provisioned node that will appear on the AMF network in the future.

**Mode** Interface Configuration for a switchport, a static aggregator, dynamic channel group or an Eth port on an AR-Series device.

**Usage notes** The port should be configured as an AMF link or cross link and should be 'down' to add or remove a provisioned node.

**Example** To provision an AMF node named node1 for port1.0.1, use the commands:

```
host1(config)# interface port1.0.1
host1(config-if)# atmf provision node1
```

**Related commands**

- `atmf provision node`
- `clone (amf-provision)`
- `configure boot config (amf-provision)`
- `configure boot system (amf-provision)`
- `copy (amf-provision)`
- `create (amf-provision)`
- `delete (amf-provision)`
- `identity (amf-provision)`
- `license-cert (amf-provision)`
- `locate (amf-provision)`
- `show atmf provision nodes`
- `show atmf links`
- `switchport atmf-link`
- `switchport atmf-crosslink`

# atmf provision node

**Overview** Use this command to provision a replacement node for a specified interface. Node provisioning is effectively the process of creating a backup file-set on a master node that can be loaded onto a provisioned node some time in the future. This file-set is created just as if the provisioned node really existed and was connected to the network. Typically these comprise configuration, operating system, and license files etc.

You can optionally provision a node with multiple device-type backups. When a device is then attached to the network, AMF uses its device-type to find the correct configuration to use. For example you can create an x510 and an x530 provisioning configuration for a node called 'node1' and if either an x510 or an x530 is attached to that node the appropriate configuration will be used.

Use the **no** variant of this command to remove a provisioned node.

**Syntax** `atmf provision node <nodename> [device <device-type>]`  
`no atmf provision node <nodename> [device <device-type>]`

Parameter	Description
<nodename>	The name of the provisioned node that will appear on the AMF network.
device	Optionally specify a device type.
<device-type>	Any valid device type e.g. AR3050s, ie200, x950. For a full list of valid device types use the command <b>atmf provision node &lt;nodename&gt; device ?</b> .

**Mode** Privileged Exec

**Usage notes** This command creates the directory structure for the provisioned node's file-set. It also switches to the AMF provision node prompt so that the nodes backup file-set can be created or updated. This is typically done with the [create \(amf-provision\)](#) or [clone \(amf-provision\)](#) commands.

For more information on AMF provisioning, see the [AMF Feature Overview and Configuration Guide](#)..

**Example** To configure node named 'node1', use the command:

```
awplus# atmf provision node node1
awplus(atmf-provision) #
```

To configure a node named 'node1' for device type 'x530', use the command:

```
awplus# atmf provision node node1 device x530
awplus(atmf-provision) #
```

**Related commands**

- atmf provision (interface)
- clone (amf-provision)
- configure boot config (amf-provision)
- configure boot system (amf-provision)
- copy (amf-provision)
- create (amf-provision)
- delete (amf-provision)
- identity (amf-provision)
- license-cert (amf-provision)
- locate (amf-provision)
- show atmf provision nodes

**Command changes** Version 5.4.9-0.1: command added

# atmf reboot-rolling

**Overview** This command enables you to reboot the nodes in an AMF working-set, one at a time, as a rolling sequence in order to minimize downtime. Once a rebooted node has finished running its configuration and its ports are up, it re-joins the AMF network and the next node is rebooted.

By adding the *url* parameter, you can also upgrade your devices' software one AMF node at a time.

The **force** parameter forces the rolling reboot to continue even if a previous node does not rejoin the AMF network. Without the **force** parameter, the unsuitable node will time-out and the rolling reboot process will stop. However, with the **force** parameter applied, the process will ignore the timeout and move on to reboot the next node in the sequence.

This command can take a significant amount of time to complete.

**Syntax** `atmf reboot-rolling [force] [<url>]`

Parameter	Description
<code>force</code>	Ignore a failed node and move on to the next node. Where a node fails to reboot a timeout is applied based on the time taken during the last reboot.
<code>&lt;url&gt;</code>	The path to the software upgrade file.

**Mode** Privileged Exec

**Usage notes** You can load the software from a variety of locations. The latest compatible release for a node will be selected from your selected location, based on the parameters and URL you have entered.

For example `card:/5.4.6/x*-5.4.6-*.rel` will select from the folder `card:/5.4.6` the latest file that matches the selection `x` (wildcard) `-5.4.6-` (wildcard).`rel`. Because `x*` is applied, each device type will be detected and its appropriate release file will be installed.

Other allowable entries are:

Entry	Used when loading software
<code>card:*.rel:</code>	from an SD card
<code>tftp:&lt;ip-address&gt;:</code>	from a TFTP server
<code>usb:</code>	from a USB flash drive
<code>flash:</code>	from flash memory, e.g. from one x930 switch to another
<code>scp:</code>	using secure copy
<code>http:</code>	from an HTTP file server

Several checks are performed to ensure the upgrade will succeed. These include checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash to a new location on each node as it is processed. The new release name will be updated using the **boot system**<release-name> command, and the old release will become the backup release file.

**NOTE:** *If you are using TFTP or HTTP, for example, to access a file on a remote device then the URL should specify the exact release filename without using wild card characters.*

On bootup the software release is verified. Should an upgrade fail, the upgrading unit will revert back to its previous software version. At the completion of this command, a report is run showing the release upgrade status of each node.

**NOTE:** *Take care when removing external media or rebooting your devices. Removing an external media while files are being written entails a significant risk of causing a file corruption.*

**Example 1** To reboot all x510 nodes in an AMF network, use the following command:

```
Bld2_Floor_1# atmf working-set group x510
```

This command returns the following type of screen output:

```
=====
node1, node2, node3:
=====

Working set join

AMF_NETWORK[3]#
```

```
ATMF_NETWORK[3]# atmf reboot-rolling
```

When the reboot has completed, a number of status screens appear. The selection of these screens will depend on the parameters set.

```
Bld2_Floor_1#atmf working-set group x510

=====
SW_Team1, SW_Team2, SW_Team3:
=====

Building_1	2	---	Incompatible
Building_2	2	x908-5.4.6-0.1.rel	Release Ready

Continue upgrading releases ? (y/n):

# atmf recover

**Overview** This command is used to manually initiate the recovery (or replication) of an AMF node, usually when a node is being replaced.

**Syntax** `atmf recover [<node-name> master <node-name>]`  
`atmf recover [<node-name> controller <node-name>]`

Parameter	Description
<i>&lt;node-name&gt;</i>	The name of the device whose configuration is to be recovered or replicated.
master <i>&lt;node-name&gt;</i>	The name of the master device that holds the required configuration information. Note that although you can omit both the node name and the master name; you cannot specify a master name unless you also specify the node name.
controller <i>&lt;node-name&gt;</i>	The name of the controller that holds the required configuration information. Note that although you can omit both the node name and the controller name; you cannot specify a controller name unless you also specify the node name.

**Mode** Privileged Exec

**Usage notes** The recovery/replication process involves loading the configuration file for a node that is either about to be replaced or has experienced some problem. You can specify the configuration file of the device being replaced by using the *<node-name>* parameter, and you can specify the name of the master node or controller holding the configuration file.

If the *<node-name>* parameter is not entered then the node will attempt to use one that has been previously configured. If the replacement node has no previous configuration (and has no previously used node-name), then the recovery will fail.

If the master or controller name is not specified then the device will poll all known AMF masters and controllers and execute an election process (based on the last successful backup and its timestamp) to determine which to use. If no valid backup master or controller is found, then this command will fail.

No error checking occurs when this command is run. Regardless of the last backup status, the recovering node will attempt to load its configuration from the specified master node or controller.

If the node has previously been configured, we recommend that you suspend any AMF backup before running this command. This is to prevent corruption of the backup files on the AMF master as it attempts to both backup and recover the node at the same time.

**Example** To recover the AMF node named Node\_10 from the AMF master node named Master\_2, use the following command:

```
Master_2# atmf recover Node_10 master Master_2
```

**Related commands**

- atmf backup stop
- show atmf backup
- show atmf

# atmf recover guest

**Overview** Use this command to initiate a guest node recovery or replacement by reloading its backup file-set that is located within the AMF backup system. Note that this command must be run on the edge node device that connects to the guest node.

**Syntax** `atmf recover guest [<guest-port>]`

Parameter	Description
<code>&lt;guest-port&gt;</code>	The port number that connects to the guest node.

**Mode** User Exec/Privileged Exec

**Example** To recover a guest on node1 port1.0.1, use the following command

```
node1# atmf recover guest port1.0.1
```

**Related commands** [show atmf backup guest](#)

# atmf recover led-off

**Overview** This command turns off the recovery failure flashing port LEDs. It reverts the LED's function to their normal operational mode, and in doing so assists with resolving the recovery problem. You can repeat this process until the recovery failure has been resolved. For more information, see the [AMF Feature Overview and Configuration Guide](#).

**Syntax** `atmf recover led-off`

**Default** Normal operational mode

**Mode** Privileged Exec

**Example** To revert the LEDs on Node1 from recovery mode display to their normal operational mode, use the command:

```
Node1# atmf recover led-off
```

**Related commands** [atmf recover](#)

# atmf recover over-eth

**Overview** Use this command to enable AMF recovery over an AR-series device's Eth port. This setting persists even after restoring a device to a 'clean' state with the [erase factory-default](#) or [atmf cleanup](#) command.

Use the **no** variant of this command to disable AMF recover over an Eth port.

**Syntax** `atmf recover over-eth`  
`no atmf recover over-eth`

**Default** Eth ports cannot be used for recovery.

**Mode** Privileged Exec

**Usage notes** AMF links over Eth ports are only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

**Example** To enable AMF recovery over an Eth port, use the command:

```
awplus# atmf recover over-eth
```

To disable AMF recovery over an Eth port, use the commands:

```
awplus# no atmf recover over-eth
```

**Related commands** [atmf-link](#)  
[atmf recover](#)  
[atmf secure-mode](#)  
[erase factory-default](#)  
[show atmf detail](#)

**Command changes** Version 5.5.0-1.1: command added

# atmf recovery-server

**Overview** Use this command on an AMF master to process recovery requests from isolated AMF nodes. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This option allows these nodes, which have no AMF neighbors, to be identified for recovery or provisioning purposes. They are identified using an identity token which is stored on the AMF master.

Use the **no** variant of this command to disable processing of recovery requests from isolated AMF nodes.

**Syntax** `atmf recovery-server`  
`no atmf recovery-server`

**Default** Recovery-server is disabled by default.

**Mode** Global Configuration

**Usage notes** Once **recovery-server** is enabled on an AMF network, the next time an isolated node is backed up its identity token will be stored in the AMF master's database. Should the device fail it can then be replaced and auto-recovery will occur as long as:

- the AMF master is accessible to the isolated node, and
- either, a DHCP server is configured to send the Uniform Resource Identifier (URI) of the AMF master to the recovering node, or
- a DNS server is configured to resolve the default recovery URI (`https://amf recovery.alliedtelesis.com`) to the IP address of the AMF master.

Provisioning of isolated nodes is achieved by creating an identity token for the new node using the [identity \(amf-provision\)](#) command.

See the [AMF Feature Overview and Configuration Guide](#) for information on preparing your network for recovering or provisioning isolated nodes.

**Example** To enable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# atmf recovery-server
```

To disable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf recovery-server
```

**Related commands**

- [atmf backup](#)
- [atmf cleanup](#)
- [identity \(amf-provision\)](#)
- [atmf virtual-link](#)

**Command changes** Version 5.4.7-2.1: command added

# atmf remote-login

**Overview** Use this command to remotely login to other AMF nodes in order to run commands as if you were a local user of that node.

**Syntax** `atmf remote-login [user <name>] <nodename>`

Parameter	Description
<name>	The name of a user on the remote node.
<nodename>	The name of the remote AMF node you are connecting to.

**Mode** Privileged Exec (This command will only run at privilege level 15)

**Usage notes** You do not need a valid login on the local device in order to run this command. The session will take you to the enable prompt on the new device. If the remote login session exits for any reason (e.g. device reboot) you will be returned to the originating node.

You can create additional user accounts on nodes. AMF's goal is to provide a uniform management plane across the whole network, so we recommend you use the same user accounts on all the nodes in the network.

In reality, though, it is not essential to have the same accounts on all the nodes. Users can remote login from one node to a second node even if they are logged into the first node with a user account that does not exist on the second node (provided that `atmf restricted-login` is disabled and the user account on the first node has privilege level 15).

Moreover, it is possible to use a RADIUS or TACACS+ server to manage user authentication, so users can log into AMF nodes using user accounts that are present on the RADIUS or TACACS+ server, and not present in the local user databases of the AMF nodes.

The software will not allow you to run multiple remote login sessions. You must exit an existing session before starting a new one.

If you disconnect from the VTY session without first exiting from the AMF remote session, the device will keep the AMF remote session open until the `exec-timeout` time expires (10 minutes by default). If the `exec-timeout` time is set to infinity (`exec-timeout 0 0`), then the device is unable to ever close the remote session. To avoid this, we recommend you use the `exit` command to close AMF remote sessions, instead of closing the associated VTY sessions. We also recommend you avoid setting the `exec-timeout` to infinity.

**Example** To remotely login from node Node10 to Node20, use the following command:

```
Node10# atmf remote-login node20
Node20>
```

To close the session on Node20 and return to Node10's command line, use the following command:

```
Node20# exit
Node10#
```

In this example, user User1 is a valid user of node5. They can remotely login from node5 to node3 by using the following commands:

```
node5# atmf remote-login user User1 node3
node3> enable
```

**Related commands** [atmf restricted-login](#)

**Command changes** Version 5.4.6-2.1: changes to AMF user account requirements

# atmf restricted-login

**Overview** By default, users who are logged into any node on an AMF network are able to manage any other node by using either working-sets or an AMF remote login. If the access provided by this feature is too wide, or contravenes network security restrictions, it can be limited by running this command, which changes the access so that:

- users who are logged into non-master nodes cannot execute any commands that involve working-sets, and
- from non-master nodes, users can use remote-login, but only to login to a user account that is valid on the remote device (via a statically configured account or RADIUS/TACACS+). Users are also required to enter the password for that user account.

Once entered on any AMF master node, this command will propagate across the network.

Use the **no** variant of this command to disable restricted login on the AMF network. This allows access to the **atmf working-set** command from any node in the AMF network.

**Syntax** `atmf restricted-login`  
`no atmf restricted-login`

**Mode** Privileged Exec

**Default** Master nodes operate with **atmf restricted-login** disabled.  
Member nodes operate with **atmf restricted-login** enabled.

**NOTE:** *The default conditions of this command vary from those applied by its “no” variant. This is because the restricted-login action is only applied by **master** nodes, and in the absence of a master node, the default is to apply the restricted action to all **member** nodes with AMF configured.*

**Usage notes** In the presence of a **master** node, its default of **atmf restricted-login disabled** will propagate to all its member nodes. Similarly, any change in this command’s status that is made on a master node, will also propagate to all its member nodes

Note that once you have run this command, certain other commands that utilize the AMF working-set command, such as the **include**, **atmf reboot-rolling** and **show atmf group members** commands, will operate only on master nodes.

Restricted-login must be enabled on AMF areas with more than 120 nodes.

**Example** To enable restricted login, use the command

```
Node_20(config)# atmf restricted-login node20
```

**Related commands** [atmf remote-login](#)  
[show atmf](#)

**Command changes** Version 5.4.6-2.1: changes to AMF user account requirements

# atmf retry guest-link

**Overview** Use this command to retry an AMF guest-link by restarting AMF guest discovery on a port if it is currently in the failed state.

If no port is specified then all configured AMF guest-link ports that are in the failed state are retried.

If a port is specified then that port will only be retried if it is both:

- configured as an AMF guest-link, and
- it is currently in the failed state.

**Syntax** `atmf retry guest-link [<interface>]`

Parameter	Description
<code>&lt;interface&gt;</code>	Name of the interface the guest-link you want to retry is configured on.

**Mode** Privileged Exec

**Example** To retry all configured AMF guest-link currently in a failed state, use the command:

```
awplus# atmf retry guest-link
```

To retry an AMF guest-link configured on port1.0.2 currently in a failed state, use the command:

```
awplus# atmf retry guest-link port1.0.2
```

**Related commands** [show atmf links guest](#)  
[switchport atmf-guestlink](#)

# atmf secure-mode

**Overview** Use this command to enable AMF secure mode on an AMF node. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before and AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once the secure mode command is run on all nodes on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

Use the **no** variant of this command to disable AMF secure mode on an AMF node.

**Syntax** `atmf secure-mode`  
`no atmf secure-mode`

**Default** Secure mode is disabled by default.

**Mode** Global Configuration

**Usage notes** When an AMF network is running in AMF secure mode the [atmf restricted-login](#) feature is automatically enabled. This restricts the [atmf working-set](#) command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

**Example** To enable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode
```

To disable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode
```

**Related commands** [atmf authorize](#)

show atmf secure-mode statistics

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate expire

**Overview** Use this command on an AMF master to expire a secure mode certificate. Running this command will force the removal of the AMF node from the network.

**Syntax** `atmf secure-mode certificate expire <node-name> [area <area-name>]`

Parameter	Description
<code>&lt;node-name&gt;</code>	Name of the AMF node you want to expire the certificate for.
<code>area</code>	Specify an AMF area.
<code>&lt;area-name&gt;</code>	Name of the AMF area you want to expire the AMF nodes certificate for.

**Mode** Privileged Exec

**Example** To remove an AMF node named "node3" from an AMF network, use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node3
```

To remove an AMF node named "node2" in an area named "area2", use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node2 area area2
```

**Related commands**

- [atmf secure-mode](#)
- [show atmf secure-mode](#)
- [show atmf secure-mode certificates](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate expiry

**Overview** Use this command to set the expiry time of AMF secure mode certificates. Once an AMF node's certificate expires it must re-authorize and obtain a new certificate from the AMF master.

Use the **no** variant of this command to reset the expiry time to 180 days.

**Syntax** `atmf secure-mode certificate expiry {<days>|infinite}`  
`no atmf secure-mode certificate expiry`

Parameter	Description
<code>&lt;days&gt;</code>	Length of time, in days, that an AMF secure mode certificate remains valid. A value between 1 and 365.
<code>infinite</code>	The authorization certificate does not expire, in other words AMF nodes stay authorized indefinitely.

**Default** The default expiry time is 180 days.

**Mode** Global Configuration

**Example** To set AMF secure mode certificate expiry to 7 days, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode certificate expiry 7
```

To set AMF secure mode certificates to never expire, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode certificate expiry infinite
```

To reset the certificate expiry to 180 days, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode certificate expiry
```

**Related commands** [atmf secure-mode](#)  
[show atmf secure-mode](#)  
[show atmf secure-mode certificates](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate renew

**Overview** Use this command to force all local certificates to expire and be renewed on an AMF secure mode network.

Secure mode certificates renew automatically but this command could be used to renew a certificate in a situation where the automatic renewal may happen while the device is not attached to the AMF network.

**Syntax** `atmf secure-mode certificate renew`

**Mode** Privileged Exec

**Example** To renew a local certificate on a AMF member or AMF master, use the command:

```
awplus# atmf secure-mode certificate renew
```

**Related commands** [show atmf secure-mode certificates](#)  
[show atmf secure-mode statistics](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode enable-all

**Overview** Use this command to enable AMF secure mode on an entire network. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before an AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once this command is run on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

This command can only be run on an AMF master.

Use the **no** variant of this command to disable AMF secure mode on an entire network.

**Syntax** `atmf secure-mode enable-all`  
`no atmf secure-mode enable-all`

**Default** Secure mode is disabled by default.

**Mode** Privileged Exec

**Usage notes** When an AMF network is running in AMF secure mode the [atmf restricted-login](#) feature is automatically enabled. This restricts the [atmf working-set](#) command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

Running **atmf secure-mode enable-all**:

- Groups all AMF members in a working set.
- Executes [clear atmf secure-mode certificates](#) on the working set of members, which removes existing secure mode certificates from all the nodes.
- Groups all the AMF masters in a working set.
- Executes [atmf authorize provision all](#) on the working set of masters, so all masters provision all nodes.
- Groups all AMF nodes in a working set.

- Runs a script which executes `atmf secure-mode` and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

Running **no atmf secure-mode enable-all**:

- Groups all AMF nodes in a working set.
- Runs a script which executes **no atmf secure-mode** and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

**NOTE:** Enabling or disabling secure mode on the network saves the running-config on every device.

**Example** To enable AMF secure mode on the entire network, use the command:

```
awplus# atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
Total number of nodes 21
21 nodes support secure-mode

Enable secure-mode across the AMF network ? (y/n): y
```

To disable AMF secure mode on the entire network, use the command:

```
awplus# no atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
% Warning: All security certificates will be deleted.
Disable secure-mode across the AMF network ? (y/n): y
```

**Related commands** [aaa authentication auth-web](#)  
[show atmf](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf select-area

**Overview** Use this command to access devices in an area outside the core area on the controller network. This command will connect you to the remote area-master of the specified area.

This command is only valid on AMF controllers.

The **no** variant of this command disconnects you from the remote area-master.

**Syntax** `atmf select-area {<area-name>|local}`  
`no atmf select-area`

Parameter	Description
<code>&lt;area-name&gt;</code>	Connect to the remote area-master of the area with this name.
<code>local</code>	Return to managing the local controller area.

**Mode** Privileged Exec

**Usage notes** After running this command, use the [atmf working-set](#) command to select the set of nodes you want to access in the remote area.

**Example** To access nodes in the area Canterbury, use the command

```
controller-1# atmf select-area Canterbury
```

This displays the following output:

```
Test_network[3]#atmf select-area Canterbury
=====
Connected to area Canterbury via host Avensis:
=====
```

To return to the local area for controller-1, use the command

```
controller-1# atmf select-area local
```

Alternatively, to return to the local area for controller-1, use the command

```
controller-1# no atmf select-area
```

**Related commands** [atmf working-set](#)

# atmf topology-gui enable

**Overview** Use this command to enable the operation of Vista Manager EX on the Master device.

Vista Manager EX delivers state-of-the-art monitoring and management for your Autonomous Management Framework™ (AMF) network, by automatically creating a complete topology map of switches, firewalls and wireless access points (APs). An expanded view includes third-party devices such as security cameras.

Use the **no** variant of this command to disable operation of Vista Manager EX.

**Syntax** atmf topology-gui enable  
no atmf topology-gui enable

**Default** Disabled by default on AMF Master and member nodes. Enabled by default on Controllers.

**Mode** Global Configuration mode

**Usage notes** To use Vista Manager EX, you must also enable the HTTP service on all AMF nodes, including all AMF masters and controllers. The HTTP service is enabled by default on AlliedWare Plus switches and disabled by default on AR-Series firewalls. To enable it, use the commands:

```
Node1# configure terminal
Node1(config)# service http
```

On one master in each AMF area in your network, you also need to configure the master to send event notifications to Vista Manager EX. To do this, use the commands:

```
Node1# configure terminal
Node1(config)# log event-host <ip-address> atmf-topology-event
```

**Examples** To enable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# atmf topology-gui enable
```

To disable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# no atmf topology-gui enable
```

**Related commands** [atmf enable](#)  
[log event-host](#)  
[service http](#)

# atmf trustpoint

**Overview** Use this command to set a PKI trustpoint for an AMF network. This command needs to be run on an AMF master or controller.

The self-signed certificate authority (CA) certificate is distributed to every node on the AMF network. It is used to verify client certificates signed by the trustpoint.

Use the **no** variant of this command to remove an AMF trustpoint.

**Syntax** `atmf trustpoint <trustpoint-name>`  
`no atmf trustpoint <trustpoint-name>`

Parameter	Description
<code>&lt;trustpoint-name&gt;</code>	Name of the trustpoint.

**Default** No trustpoint is configured by default.

**Mode** Global Configuration

**Usage notes** Before using the **atmf trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'our\_trustpoint' with keypair 'our\_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint our_trustpoint
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair our_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate our_trustpoint
awplus# crypto pki enroll our_trustpoint
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#)

**Example** To configure an AMF trustpoint for the trustpoint 'our\_trustpoint', use the commands:

```
awplus# configure terminal
awplus(config)# atmf trustpoint our_trustpoint
```

To remove an AMF trustpoint for the trustpoint 'our\_trustpoint', use the commands:

```
awplus# configure terminal
awplus(config)# no atmf trustpoint our_trustpoint
```

**Related commands** [crypto pki trustpoint](#)  
[show atmf](#)

**Command changes** Version 5.4.7-2.1: command added

# atmf virtual-crosslink

**Overview** Use this command to create a virtual crosslink. A virtual crosslink connects an AMF master or controller on a physical device to a Virtual AMF Appliance (VAA) master or controller.

All AMF master nodes must reside in the same AMF domain and are required to be directly connected using AMF crosslinks. In order to be able to meet this requirement for AMF masters running on VAAs, a virtual crosslink connects the AMF master or controller on the physical device to the master or controller on the VAA.

Use the **no** variant of this command to remove a virtual crosslink.

**Syntax** `atmf virtual-crosslink id <local-id> ip <local-ip> remote-id <remote-id> remote-ip <remote-ip>`  
`no atmf virtual-crosslink id <local-id>`

Parameter	Description
<local-id>	ID of the local tunnel port, a value between 1 and 4094.
<local-ip>	IPv4 address of the local tunnel port in a.b.c.d format.
<remote-id>	ID of the remote tunnel port, a value between 1 and 4094.
<remote-ip>	IPv4 address of the remote tunnel port in a.b.c.d format.

**Default** No AMF virtual crosslinks are created by default.

**Mode** Global Configuration

**Usage notes** This command allows a virtual tunnel to be created between two remote sites over a layer 3 link. The tunnel encapsulates AMF packets and allows them to be sent transparently across a Wide Area Network (WAN) such as the Internet.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address. Each side of the tunnel must be configured with the same, but mirrored parameters.

**NOTE:** *Virtual crosslinks are not supported on AMF container masters, therefore if multiple tenants on a single VAA host are configured for secure mode, only a single AMF master is supported per area.*

**Example** To setup a virtual link from a local site, "siteA", to a remote site, "siteB", (assuming there is already IP connectivity between the sites), run the following commands at the local site:

```
siteA# configure terminal
siteA(config)# atmf virtual-crosslink id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1
```

At the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# atmf virtual-crosslink id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1
```

To remove this virtual crosslink, run the following commands on the local site:

```
siteA# configure terminal
siteA(config)# no atmf virtual-crosslink id 5
```

On the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# no atmf virtual-crosslink id 10
```

**Related  
commands**

[atmf virtual-crosslink](#)  
[show atmf links](#)  
[switchport atmf-crosslink](#)

**Command  
changes**

Version 5.4.7-0.3: command added

# atmf virtual-link

**Overview** This command creates one or more Layer 2 tunnels that enable AMF nodes to transparently communicate across a wide area network using Layer 2 connectivity protocols.

Once connected through the tunnel, the remote member will have the same AMF capabilities as a directly connected AMF member.

Use the **no** variant of this command to remove the specified virtual link.

**Syntax**

```
atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>
remote-ip <a.b.c.d> [remote-area <area-name>]

atmf virtual-link id <1-4094> interface <interface-name>
remote-id <1-4094> remote-ip <a.b.c.d> [remote-area
<area-name>]

no atmf virtual-link id <1-4094>
```

Parameter	Description
id <1-4094>	ID of the local tunnel point, in the range 1 to 4094.
ip <a.b.c.d>	Specify the local IP address of the local interface for the virtual-link (alternatively you can specify the interface's name, see below).
interface <interface-name>	Specify the local interface name for the virtual-link. This allows you to use a dynamic, rather than a static, local IP address.
remote-id<1-4094>	The ID of the (same) tunnel that will be applied by the remote node. Note that this must match the local-id that is defined on the remote node. This means that (for the same tunnel) the local and remote tunnel IDs are reversed on the local and remote nodes.
remote-ip <a.b.c.d>	The IP address of the remote node.
remote-area <area-name>	The name of the remote area connected to this virtual-link.

**Mode** Global Configuration

**Usage notes** The Layer 2 tunnel that this command creates enables a local AMF session to appear to pass transparently across a Wide Area Network (WAN) such as the Internet. The addresses configured as the local and remote tunnel IP addresses must have IP connectivity to each other. If the tunnel is configured to connect a head office and branch office over the Internet, typically this would involve using some type of managed WAN service such as a site-to-site VPN. Tunnels are only supported using IPv4.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address. A reciprocal configuration is also required on the corresponding remote device. The local tunnel ID must be unique to the device on which it is configured.

If an interface acquires its IP address dynamically then the local side of the tunnel can be specified by using the interface's name instead of using its IP address. When using a dynamic local address the remote address of the other side of the virtual-link must be configured with either:

- the IP address of the NAT device the dynamically configured interface is behind, or
- 0.0.0.0, if the virtual-link is configured as a secure virtual-link.

For instructions on how to configure dynamic IP addresses on virtual-links, see the [AMF Feature Overview and Configuration Guide](#).

The tunneled link may operate via external (non AlliedWare Plus) routers in order to provide wide area network connectivity. However in this configuration, the routers perform a conventional router to router connection. The protocol tunneling function is accomplished by the AMF nodes.

**NOTE:** AMF cannot achieve zero touch replacement of the remote device that terminates the tunnel connection, because you must pre-configure the local IP address and tunnel ID on that remote device.

**Example 1** Use the following commands to create the tunnel shown in the figure below.

Figure 62-1: AMF virtual link example

```
Node_10(config)# atmf virtual-link id 1 ip 192.168.1.1
remote-id 2 remote-ip 192.168.2.1

Node_20(config)# atmf virtual-link id 2 ip 192.168.2.1
remote-id 1 remote-ip 192.168.1.1
```

**Example 2** To set up an area virtual link to a remote site (assuming IP connectivity between the sites already), one site must run the following commands:

```
SiteA# configure terminal
SiteA(config)# atmf virtual-link id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1 remote-area SiteB-AREA
```

The second site must run the following commands:

```
SiteB# configure terminal
SiteB(config)# atmf virtual-link id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1 remote-area SiteA-AREA
```

Before you can apply the above **atmf virtual-link** command, you must configure the area names *SiteB-AREA* and *SiteA-AREA*.

**Command changes** Version 5.4.9-0.1: **interface** parameter added

# atmf virtual-link description

**Overview** Use this command to add a description to an existing AMF virtual-link. Use the **no** variant of this command to remove a description from an AMF virtual-link.

**Syntax** `atmf virtual-link id <1-4094> description <description>`  
`no atmf virtual-link id <1-4094> description`

Parameter	Description
<code>id &lt;1-4094&gt;</code>	ID of the local tunnel point.
<code>&lt;description&gt;</code>	A description for the virtual-link.

**Default** No description is set by default.

**Mode** Global Configuration

**Example** To add a description to the virtual-link with id '5', use the commands:

```
awplus# configure terminal
awplus(config)# atmf virtual-link id 5 description TO SITE B
```

To remove a description from the virtual-link with id '5', use the commands:

```
awplus# configure terminal
awplus(config)# no atmf virtual-link id 5
```

**Related commands** [atmf virtual-link](#)  
[show atmf links](#)  
[show atmf virtual-links](#)

# atmf virtual-link protection

**Overview** Use this command to add protection to an existing AMF virtual-link. Secure AMF virtual-links encapsulate the L2TPv3 frames of the virtual-link with IPsec.

Use the **no** variant of this command to remove protection from an AMF virtual-link.

**Syntax** `atmf virtual-link id <1-4094> protection ipsec key [8]  
<key-string>`  
`no atmf virtual-link id <1-4094> protection`

Parameter	Description
id	Specify the link ID.
<1-4094>	Link ID in the range 1 to 4094,
protection	Protection is on for this link.
ipsec	Security provided using IPsec.
key	Set the shared key.
8	Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off.
<key-string>	Specify the shared key for the link.

**Default** Protection is off by default.

**Mode** Global Configuration

**Usage notes** The following limitations need to be considered when creating secure virtual-links.

- Switch devices support a maximum of 20 downstream AMF nodes when using a secure virtual-link as an uplink.
- When there are two or more AMF members behind a shared NAT device, only one of the members will be able to use secure virtual-links.
- An AMF Multi-tenant environment supports a maximum cumulative total of 1200 secure virtual-links across all AMF containers.

Secure virtual-links are only supported on the following device listed in the table below. There is also a limit to the number of links these devices support.

Device	Virtual-link Limit
AMF Cloud/ VAA	300
AR4050S AR3050S AR2050V AR2010V	60
x220 x230/x230L x310 x510/x510L IX5-28GPX	2

**Example** To create and configure a virtual link with protection first create the virtual-link:

```
Host-A# configure terminal
```

```
Host-A(config)# atmf virtual-link id 1 ip 192.168.1.1 remote-id
2 remote-ip 192.168.2.1
```

Enable protection on the virtual link:

```
Host-A(config)# atmf virtual-link id 1 protection ipsec key
securepassword
```

Repeat these steps on the other side of the link:

```
Host-B(config)# atmf virtual-link id 2 ip 192.168.2.1 remote-id
1 remote-ip 192.168.1.1
```

```
Host-B(config)# atmf virtual-link id 2 protection ipsec key
securepassword
```

changes** Version 5.4.9-0.1: command added

# atmf working-set

**Overview** Use this command to execute commands across an individually listed set of AMF nodes or across a named group of nodes.

Note that this command can only be run on a master node.

Use the **no** variant of this command to remove members or groups from the current working-set.

**Syntax**

```
atmf working-set {[<node-list>]| [group
{<group-list>|all|local|current}]}
```

```
no atmf working-set {[<node-list>]| [group <group-list>]}
```

Parameter	Description
<code>&lt;node-list&gt;</code>	A comma delimited list (without spaces) of nodes to be included in the working-set.
<code>group</code>	The AMF group.
<code>&lt;group-list&gt;</code>	A comma delimited list (without spaces) of groups to be included in the working-set. Note that this can include either defined groups, or any of the Automatic, or Implicit Groups shown earlier in the bulleted list of groups.
<code>all</code>	All nodes in the AMF.
<code>local</code>	Local node Running this command with the parameters <b>group local</b> will return you to the local prompt and local node connectivity.
<code>current</code>	Nodes in current list.

**Mode** Privileged Exec

**Usage notes** You can put AMF nodes into groups by using the [atmf group \(membership\)](#) command.

This command opens a session on multiple network devices. When you change the working set to anything other than the local device, the prompt will change to the AMF network name, followed by the size of the working set, shown in square brackets. This command has to be run at privilege level 15.

In addition to the user defined groups, the following system assigned groups are automatically created:

- Implicit Groups
  - local: The originating node.
  - current: All nodes that comprise the current working-set.
  - all: All nodes in the AMF.

- Automatic Groups - These can be defined by hardware architecture, e.g. x510, x610, x8100, AR3050S or AR4050S, or by certain AMF nodal designations such as master.

Note that the Implicit Groups do not appear in `show atmf group` command output. If a node is an AMF master it will be automatically added to the master group.

**Example 1** To add all nodes in the AMF to the working-set, use the command:

```
node1# atmf working-set group all
```

**NOTE:** This command adds the implicit group "all" to the working set, where "all" comprises all nodes in the AMF.

This command displays an output screen similar to the one shown below:

```
=====
node1, node2, node3, node4, node5, node6:
=====

Working set join

ATMF_NETWORK_Name[6]#
```

**Example 2** To return to the local prompt, and connect to only the local node, use the command:

```
ATMF_Network_Name[6]# atmf working-set group local
node1#
```

The following table describes the meaning of the prompts in this example.

Parameter	Description
ATMF_Network_Name	The name of the AMF network, as set by the <code>atmf network-name</code> command.
[6]	The number of nodes in the working-set.
node1	The name of the local node, as set by the <code>hostname</code> command.

# bridge-group

**Overview** Use this command to connect an AMF container to a bridge created on a Virtual AMF Appliance (VAA) virtual machine. This allows the AMF container to connect to a physical network.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove a bridge-group from an AMF container.

**Syntax** `bridge-group <bridge-id>`  
`no bridge-group`

Parameter	Description
<code>&lt;bridge-id&gt;</code>	The ID of the bridge group to join, a number between 1 and 64.

**Mode** AMF Container Configuration

**Usage notes** Each container has two virtual interfaces:

- 1) Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, and configured using this [area-link](#) command.
- 2) Interface eth1, used to connect to the outside world using a bridged L2 network link, and configured using the **bridge-group** command.

Before using this command, a bridge must be created with the same bridge-id on the VAA host using the **bridge <bridge-id>** command.

See the [AMF Feature Overview and Configuration Guide](#) for more information on configuring the bridge.

**Example** To create a bridge group for AMF container "vac-wlg-1" and , use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# bridge-group 1
```

**Related commands** [atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# clear application-proxy threat-protection

**Overview** Use this command to clear the threat protection for a specified address.

**Syntax** `clear application-proxy threat-protection {<ip-address>|<mac-address>|all}`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The IPv4 address you wish to clear the threat for, in A.B.C.D format.
<code>&lt;mac-address&gt;</code>	The MAC address you wish to clear the threat for, in HHHH.HHHH.HHHH format.
<code>all</code>	Clear the threat for all IPv4 and MAC addresses.

**Mode** Privileged Exec

**Example** To clear the threat for 10.34.199.117, use the command:

```
awplus# clear application-proxy threat-protection 10.34.199.117
```

**Related commands**

- [application-proxy quarantine-vlan](#)
- [application-proxy threat-protection](#)

- [service atmf-application-proxy](#)
- [show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# clear atmf links

**Overview** Use this command with no parameters to manually reset all the AMF links on a device. You can optionally specify an interface or range of interfaces to reset the links on.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct, view of the network.

**Syntax** `clear atmf links [<interface-list>]`

Parameter	Description
<code>&lt;interface-list&gt;</code>	<p>The interfaces or ports to perform the reset on. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.1)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a local port (e.g. of0)</li><li>• You can specify a continuous range of interfaces separated by a hyphen, or a comma-separated list (e.g. port1.0.1, port1.0.4-port1.0.18).</li></ul> <p>The specified interfaces must exist. If this parameter is left out then all links of the specified type will be reset on the device.</p>

**Mode** Privileged Exec

**Example** To clear all AMF links on a device, use the following command:

```
awplus# clear atmf links
```

To clear all AMF links on port1.0.1 to port1.0.4 and static aggregator sa1, use the following command:

```
awplus# clear atmf links port1.0.1-port1.0.4,sa1
```

**Related commands** [clear atmf links virtual](#)  
[show atmf links](#)

**Command changes** Version 5.4.8-2.1: command added

# clear atmf links virtual

**Overview** Use this command with no parameters to manually reset all the AMF virtual links on a device. You can, optionally, specify a comma separated list of virtual links to reset.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct view of the network.

**Syntax** `clear atmf links virtual [<virtuallink-list>]`

Parameter	Description
<code>&lt;virtuallink-list&gt;</code>	A single, or list, of AMF virtual link identifiers to reset. This must be a comma separated list of links e.g. <code>vlink1, vlink2, vlink3</code> . Specifying a link range e.g. <code>vlink1-vlink3</code> is not supported.

**Mode** Privileged Exec

**Example** To clear all AMF virtual links on a device, use the following command:

```
awplus# clear atmf links virtual
```

To clear AMF virtual links `vlink11` and `vlink21`, use the following command:

```
awplus# clear atmf links virtual vlink11,vlink22
```

**Related commands** [clear atmf links](#)  
[show atmf links](#)

**Command changes** Version 5.4.8-2.1: command added

# clear atmf links statistics

**Overview** This command resets the values of all AMF link, port, and global statistics to zero.

**Syntax** `clear atmf links statistics`

**Mode** Privilege Exec

**Example** To reset the AMF link statistics values, use the command:

```
node_1# clear atmf links statistics
```

**Related commands** [show atmf links statistics](#)

# clear atmf recovery-file

**Overview** Use this command to delete all of a node's recovery files. It deletes the recovery files stored on:

- the local node,
- neighbor nodes, and
- external media (USB or SD card).

**Syntax** `clear atmf recovery-file`

**Mode** Privileged Exec

**Usage notes** AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

An AMF node with one of these special links pushes its startup configuration to its neighbors and to any attached external media. It then fetches and applies this configuration at recovery time. This configuration enables it to contact the AMF master and initiate a recovery.

Recovery files can become out of date if:

- a node's neighbor is off line when changes are made to its configuration, or
- when a node no longer contains a special link.

**Example** To clear a node's recovery files, use the command:

```
node1# clear atmf recovery-file
```

**Output** Figure 62-2: If AlliedWare Plus detects that a node contains a special link then the following message is displayed

```
node1#clear atmf recovery-file
% Warning: ATMF recovery files have been removed.
ATMF recovery may fail. Please save running-configuration.
```

**Related commands** [show atmf recovery-file](#)

**Command changes** Version 5.4.8-0.2: command added

# clear atmf secure-mode certificates

**Overview** Use this command to remove all certificates from an AMF member or master. AMF nodes will need to be re-authorized once this command has been run.

**Syntax** `clear atmf secure-mode certificates`

**Mode** Privileged Exec

**Example** To clear all certificates from an AMF node, use the command:

```
awplus# clear atmf secure-mode certificates
```

If this is the only master on the network you will see the following warning:

```
% Warning: This node is the only master in the network!
All the nodes will become isolated and refuse to join any ATMF
network. The certificates on all the isolated nodes must be
cleared before rejoining an ATMF network will be possible.

To clear certificates a reboot of the device is required.
Clear certificates and Reboot ? (y/n):
```

On an AMF member you will see the following message:

```
To clear certificates a reboot of the device is required.
Clear certificates and Reboot ? (y/n):
```

**Related commands**

**Command changes** Version 5.4.7-0.3: command added

# clear atmf secure-mode statistics

**Overview** Use this command to reset all secure mode statistics to 0.

**Syntax** `clear atmf secure-mode statistics`

**Mode** Privileged Exec

**Example** To reset the AMF secure mode statistics information, use the command:

```
awplus# clear atmf secure-mode statistic
```

**Related commands** [show atmf secure-mode](#)  
[show atmf secure-mode statistics](#)

**Command changes** Version 5.4.7-0.3: command added

# clone (amf-provision)

**Overview** This command sets up a space on the backup media for use with a provisioned node and copies into it almost all files and directories from a chosen backup or provisioned node.

Alternatively, you can set up a new, unique provisioned node by using the command [create \(amf-provision\)](#).

**Syntax** `clone <source-nodename>`

Parameter	Description
<code>&lt;source-nodename&gt;</code>	The name of the node whose configuration is to be copied for loading to the clone.

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network.

When using this command it is important to be aware of the following:

- A copy of `<media>:atmf/<atmf_name>/nodes/<source_node>/flash` will be made for the provisioned node and stored in the backup media.
- The directory `<node_backup_dir>/flash/.config/ssh` is excluded from the copy.
- All contents of `<root_backup_dir>/nodes/<nodename>` will be deleted or overwritten.
- Settings for the expected location of other provisioned nodes are excluded from the copy.

The active and backup configuration files are automatically modified in the following ways:

- The **hostname** command is modified to match the name of the provisioned node.
- The **stack virtual-chassis-id** command is removed, if present.

**Example** To copy from the backup of 'device2' to create backup files for the new provisioned node 'device3' use the following command:

```
device1# atmf provision node device3
device1(atmf-provision)# clone device2
```

Figure 62-3: Sample output from the **clone** command

```
device1# atmf provision node device3
device1(atmf-provision)#clone device2
Copying...
Successful operation
```

To confirm that a new provisioned node has been cloned, use the command:

```
device1# show atmf backup
```

The output from this command is shown in the following figure, and shows the details of the new provisioned node 'device3'.

Figure 62-4: Sample output from the **show atmf backup** command

```
device1#show atmf backup

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# configure boot config (amf-provision)

**Overview** This command sets the configuration file to use during the next boot cycle. This command can also set a backup configuration file to use if the main configuration file cannot be accessed for an AMF provisioned node. To unset the boot configuration or the backup boot configuration use the **no boot** command.

**Syntax** `configure boot config [backup] <file-path|URL>`  
`configure no boot config [backup]`

Parameter	Description
backup	Specify that this is the backup configuration file.
<file-path URL>	The path or URL and name of the configuration file.

**Default** No boot configuration files or backup configuration files are specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** When using this command to set a backup configuration file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

**Examples** To set the configuration file 'branch.cfg' on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot config
branch.cfg
```

To set the configuration file 'backup.cfg' as the backup to the main configuration file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName(atmf-provision)# configure boot config backup
usb:/atmf/amf_net/nodes/node1/config/backup.cfg
```

To unset the boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config
```

To unset the backup boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config backup
```

**Command  
changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# configure boot system (amf-provision)

**Overview** This command sets the release file that will load onto a specified provisioned node during the next boot cycle. This command can also set the backup release file to be loaded for an AMF provisioned node. To unset the boot system release file or the backup boot release file use the **no boot** command.

Use the **no** variant of this command to return to the default.

This command can only be run on AMF master nodes.

**Syntax** `configure boot system [backup] <file-path|URL>`  
`configure no boot system [backup]`

Parameter	Description
<file-path URL>	The path or URL and name of the release file.

**Default** No boot release file or backup release files are specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** When using this command to set a backup release file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

**Examples** To set the release file x930-5.4.9-0.1.rel on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system
x930-5.4.9-0.1.rel
```

To set the backup release file x930-5.4.8-2.5.rel as the backup to the main release file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system backup
card:/atmf/amf_net/nodes/node1/flash/x930-5.4.8-2.5.rel
```

To unset the boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system
```

To unset the backup boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system backup
```

**Related commands** [atmf provision \(interface\)](#)

atmf provision node  
clone (amf-provision)

locate (amf-provision)  
show atmf provision nodes

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# copy (amf-provision)

**Overview** Use this command to copy configuration and release files for the node you are provisioning.

For more information about using the copy command see [copy \(filename\)](#) in the File and Configuration Management chapter.

**Syntax** `copy [force] <source-name> <destination-name>`

Parameter	Description
<code>force</code>	This parameter forces the copy command to overwrite the destination file, if it already exists, without prompting the user for confirmation.
<code>&lt;source-name&gt;</code>	The filename and path of the source file. See the <a href="#">Introduction</a> of the File and Configuration Management chapter for valid syntax.
<code>&lt;destination-name&gt;</code>	The filename and path for the destination file. See <a href="#">Introduction</a> of the File and Configuration Management chapter for valid syntax.

**Mode** AMF Provisioning

**Example** To copy a configuration file named `current.cfg` from Node\_4's Flash into the `future_node` directory, and set that configuration file to load onto `future_node`, use the following commands:

```
node_4# atmf provision node future_node
node_4(atmf-provision)# create
node_4(atmf-provision)# locate
node_4(atmf-provision)# copy flash:current.cfg
./future_node.cfg
node_4(atmf-provision)# configure boot config future_node.cfg
```

**Related commands**

- [create \(amf-provision\)](#)
- [delete \(amf-provision\)](#)
- [locate \(amf-provision\)](#)
- [show atmf provision nodes](#)

**Command changes** Version 5.4.9-2.1: command added

# create (amf-provision)

**Overview** This command sets up an empty directory on the backup media for use with a provisioned node. This directory can have configuration and release files copied to it from existing devices. Alternatively, the configuration files can be created by the user.

An alternative way to create a new provisioned node is with the command [clone \(amf-provision\)](#).

This command can only run on AMF master nodes.

**Syntax** create

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network.

A date and time is assigned to the new provisioning directory reflecting when this command was executed. If there is a backup or provisioned node with the same name on another AMF master then the most recent one will be used.

**Example** To create a new provisioned node named "device2" use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# create
```

Running this command will create the following directories:

- `<media>:atmf/<atmf_name>/nodes/<node>`
- `<media>:atmf/<atmf_name>/nodes/<node>/flash`

To confirm the new node's settings, use the command:

```
device1# show atmf backup
```

The output for the **show atmf backup** command is shown in the following figure, and shows details for the new provisioned node 'device2'.

Figure 62-5: Sample output from the **show atmf backup** command

```
device1#show atmf backup

Scheduled Backup Enabled
 Schedule 1 per day starting at 03:00
 Next Backup Time 01 Oct 2018 03:00

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# debug atmf

**Overview** This command enables the AMF debugging facilities, and displays information that is relevant (only) to the current node. The detail of the debugging displayed depends on the parameters specified.

If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

The **no** variant of this command disables either all AMF debugging information, or only the particular information as selected by the command's parameters.

**Syntax**

```
debug atmf
[link|crosslink|arealink|database|neighbor|error|all]

no debug atmf
[link|crosslink|arealink|database|neighbor|error|all]
```

Parameter	Description
link	Output displays debugging information relating to uplink or downlink information.
crosslink	Output displays all crosslink events.
arealink	Output displays all arealink events.
database	Output displays only notable database events.
neighbor	Output displays only notable AMF neighbor events.
error	Output displays AMF error events.
all	Output displays all AMF events.

**Default** All debugging facilities are disabled.

**Mode** User Exec and Global Configuration

**Usage notes** If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

**NOTE:** An alias to the **no** variant of this command is [undebg atmf](#) on page 3338.

**Examples** To enable all AMF debugging, use the command:

```
node_1# debug atmf
```

To enable AMF uplink and downlink debugging, use the command:

```
node_1# debug atmf link
```

To enable AMF error debugging, use the command:

```
node_1# debug atmf error
```

**Related** no debug all  
**commands**

# debug atmf packet

**Overview** This command configures AMF Packet debugging parameters. The debug only displays information relevant to the current node. The command has following parameters:

**Syntax** debug atmf packet [direction {rx|tx|both}] [level {1|2|3}]  
[timeout <seconds>] [num-pkts <quantity>]  
[filter {node <name>|interface <ifname>}  
[pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]]]

## Simplified Syntax

debug atmf packet	[direction {rx tx both}]
	[level {[1][2 3]}]
	[timeout <seconds>]
	[num-pkts <quantity>]
debug atmf packet filter	[node <name>]
	[interface <ifname>]
	[pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]]]

**NOTE:** You can combine the syntax components shown, but when doing so, you must retain their original order.

**Default** Level 1, both Tx and Rx, a timeout of 60 seconds with no filters applied.

**NOTE:** An alias to the **no** variant of this command - *undebug atmf* - can be found elsewhere in this chapter.

**Mode** User Exec and Global Configuration

**Usage notes** If no additional parameters are specified, then the command output will apply a default selection of parameters shown below:

Parameter	Description
direction	Sets debug to packet received, transmitted, or both
rx	packets received by this node
tx	Packets sent from this node
1	AMF Packet Control header Information, Packet Sequence Number. Enter 1 to select this level.
2	AMF Detailed Packet Information. Enter 2 to select this level.
3	AMF Packet HEX dump. Enter 3 to select this level.
timeout	Sets the execution timeout for packet logging

Parameter	Description
<seconds>	Seconds
num-pkts	Sets the number of packets to be dumped
<quantity>	The actual number of packets
filter	Sets debug to filter packets
node	Sets the filter on packets for a particular Node
<name>	The name of the remote node
interface	Sets the filter to dump packets from an interface (portx.x.x) on the local node
<ifname>	Interface port or virtual-link
pkt-type	Sets the filter on packets with a particular AMF packet type
1	Crosslink Hello BPDU packet with crosslink links information. Enter 1 to select this packet type.
2	Crosslink Hello BPDU packet with downlink domain information. Enter 2 to select this packet type.
3	Crosslink Hello BPDU packet with uplink information. Enter 3 to select this packet type.
4	Downlink and uplink hello BPDU packets. Enter 4 to select this packet type.
5	Non broadcast hello unicast packets. Enter 5 to select this packet type.
6	Stack hello unicast packets. Enter 6 to select this packet type.
7	Database description. Enter 7 to select this packet type.
8	DBE request. Enter 8 to select this packet type.
9	DBE update. Enter 9 to select this packet type.
10	DBE bitmap update. Enter 10 to select this packet type.
11	DBE acknowledgment. Enter 11 to select this packet type.
12	Area Hello Packets. Enter 12 to select this packet type.
13	Gateway Hello Packets. Enter 13 to select this packet type.

**Examples** To set a packet debug on node 1 with level 1 and no timeout, use the command:

```
node_1# debug atmf packet direction tx timeout 0
```

To set a packet debug with level 3 and filter packets received from AMF node 1:

```
node_1# debug atmf packet direction tx level 3 filter node_1
```

To enable send and receive 500 packets only on vlink1 for packet types 1, 7, and 11, use the command:

```
node_1# debug atmf packet num-pkts 500 filter interface vlink1
pkt-type 1 7 11
```

This example applies the **debug atmf packet** command and combines many of its options:

```
node_1# debug atmf packet direction rx level 1 num-pkts 60
filter node x930 interface port1.0.1 pkt-type 4 7 10
```

# delete (amf-provision)

**Overview** This command deletes files that have been created for loading onto a provisioned node. It can only be run on master nodes.

**Syntax** delete

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network. The command will only work if the provisioned node specified in the command has already been set up (although the device itself is still yet to be installed). Otherwise, an error message is shown when the command is run.

You may want to use the **delete** command to delete a provisioned node that was created in error or that is no longer needed.

This command cannot be used to delete backups created by the AMF backup procedure. In this case, use the command [atmf backup delete](#) to delete the files.

**NOTE:** *This command allows provisioned entries to be deleted even if they have been referenced by the [atmf provision \(interface\)](#) command, so take care to only delete unwanted entries.*

**Example** To delete backup files for a provisioned node named device3 use the command:

```
device1# atmf provision node device3
device1(atmf-provision)# delete
```

To confirm that the backup files for provisioned node device3 have been deleted use the command:

```
device1# show atmf backup
```

The output should show that the provisioned node device3 no longer exists in the backup file, as shown in the figure below:

Figure 62-6: Sample output showing the **show atmf backup** command

```
device1#show atmf backup

Scheduled Backup Enabled

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# discovery

**Overview** Use this command to specify how AMF learns about guest nodes.

AMF nodes gather information about guest nodes by using one of two internally defined discovery methods: static or dynamic.

With dynamic learning (the default method), AMF learns IP address and MAC addresses of guest nodes from LLDP or DHCP snooping. Dynamic learning is only supported when using IPv4. For IPv6, use static learning.

With dynamic learning, ensure that the command `ip dhcp snooping delete-by-linkdown` is set.

With static learning, you use the `switchport atmf-guestlink` command to specify the guest class name and IP address of the guest node attached to each individual switch port. AMF then learns the MAC addresses of each of the guests of that class from ARP or Neighbor discovery tables.

If you are using the static method, ensure that you have configured the appropriate class type for each of your statically discovered guest nodes.

The **no** variant of this command returns the discovery method to **dynamic**.

**Syntax** `discovery [static|dynamic]`  
`no discovery`

Parameter	Description
<code>static</code>	Statically assigned.
<code>dynamic</code>	Learned from DCHCP Snooping or LLDP.

**Default** Dynamic

**Mode** AMF Guest Configuration

**Usage notes** This command is one of several modal commands that are configured and applied for a specific guest-class (mode). Its settings are automatically applied to a guest-node link by the `switchport atmf-guestlink` command.

**NOTE:** *AMF guest nodes are not supported on ports using the OpenFlow protocol.*

**Example 1** To configure the discovery of the guest-class camera to operate statically, use the following commands:

```
Node1# configure terminal
Node1(config)# atmf guest-class camera
Node1(config-atmf-guest)# discovery static
```

**Example 2** To return the discovery method for the guest class TQ4600-1 to its default of **dynamic**, use the following commands:

```
Node1# configure terminal
Node1(config)# atmf guest-class TQ4600-1
Node1(config-atmf-guest)# no discovery
```

**Related commands**

- atmf guest-class
- switchport atmf-guestlink
- show atmf links guest
- show atmf nodes

# description (amf-container)

**Overview** Use this command to set the description on an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove the description from an AMF container.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	Enter up to 128 characters of text describing the AMF container.

**Mode** AMF Container Configuration

**Example** To set the description for AMF container “vac-wlg-1” to “Wellington area”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# description Wellington area
```

To remove the description for AMF container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no description
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# erase factory-default

**Overview** This command erases all data from NVS and all data from flash **except** the following:

- the boot release file (a .rel file) and its release setting file
- all license files
- the latest GUI release file

The device is then rebooted and returned to its factory default condition. The device can then be used for AMF automatic node recovery.

**Syntax** `erase factory-default`

**Mode** Privileged Exec

**Usage notes** This command is an alias to the [atmf cleanup](#) command.

Note that this command can only be used on standalone switches, not stacked switches.

**Example** To erase data, use the command:

```
Node_1# erase factory-default
```

```
This command will erase all NVS, all flash contents except for
the boot release, a GUI resource file, and any license files,
and then reboot the switch. Continue? (y/n):y
```

**Related commands** [atmf cleanup](#)

# http-enable

**Overview** This command is used to enable GUI access to a guest node. When **http-enable** is configured, the port number is set to its default of 80. If the guest node is using a different port for HTTP, you can configure this using the **port** parameter.

This command is used to inform the GUI that this device has an HTTP interface at the specified port number so that a suitable URL can be provided to the user.

Use the **no** variant of this command to disable HTTP.

**Syntax** `http-enable [port <port-number>]`  
`no http-enable`

Parameter	Description
port	TCP port number.
<port-number>	The port number to be configured.

**Default** Not set

**Mode** AMF Guest Configuration

**Usage notes** If **http-enable** is selected without a **port** parameter the port number will default to 80.

**Example** To enable HTTP access to a guest node on port 80 (the default), use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable
```

To enable HTTP access to a guest node on port 400, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable port 400
```

To disable HTTP access to a guest node, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# no http-enable
```

**Related commands** [atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf links guest](#)

`show atmf nodes`

# identity (amf-provision)

**Overview** Use this command to create an identity token for provisioning an isolated AMF node. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This command allows these nodes, which have no AMF neighbors, to be identified for provisioning purposes. They are identified using an identity token which is based on either the next-hop MAC address of the provisioned node, or the serial number of the device being provisioned. This identity token is stored on the AMF master.

Use the **no** variant of this command to remove the identity token for a node.

**Syntax**

```
identity mac-address <mac-address> prefix
<ip-address/prefix-length>

identity serial-number <serial-number> prefix
<ip-address/prefix-length>

no identity
```

Parameter	Description
mac-address	Specify the next-hop MAC address of the device being provisioned.
<mac-address>	MAC address of the port the provisioned node is connected to, in the format xxxx.xxxx.xxxx.
serial-number	Specify the serial number of the device to be provisioned.
<serial-number>	Serial number of the device that is being provisioned.
prefix	IPv4 address, and prefix length, of the virtual-link interface on the isolated node
<ip-address/ prefix-length>	IPv4 address, and prefix length, in A.B.C.D/M format.

**Mode** AMF Provisioning

**Usage notes** To provision an isolated node, first create a configuration for the node using the [create \(amf-provision\)](#) and/or the [clone \(amf-provision\)](#) commands.

Then create an identity token for the provisioned node by either specifying its next-hop MAC address or by specifying the serial number of the replacement device. The advantage of using the next-hop MAC address is that any device, regardless of its serial number, can be added to the network but using the serial number maybe preferred in situations where the next-hop MAC address is not easy to obtain.

The [atmf recovery-server](#) option must be enabled on the AMF master before attempting to provision the device. This option allows the AMF master to process recovery requests from isolated AMF nodes.

See the [AMF Feature Overview and Configuration Guide](#) for information on preparing your network for recovering or provisioning isolated nodes.

**Example** To create a identity token on your AMF master for a device named “my-x930” with serial number “A10064A172100008”, use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# identity serial-number
A10064A172100008 prefix 192.168.2.25/24
```

To create a identity token on your AMF master for a device named “my-x930” with next-hop MAC address “0000.cd28.0880”, use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# identity mac-address 0000.cd28.0880
prefix 192.168.2.25/24
```

To delete the identity token from your AMF master for a device named “my-x930”, use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# no identity
```

**Related commands**

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode  
Version 5.4.7-2.1: command added

# license-cert (amf-provision)

**Overview** This command is used to set up the license certificate for a provisioned node.

The certificate file usually has all the license details for the network, and can be stored anywhere in the network. This command makes a hidden copy of the certificate file and stores it in the space set up for the provisioned node on AMF backup media.

For node provisioning, the new device has not yet been part of the AMF network, so the user is unlikely to know its product ID or its MAC address. When such a device joins the network, assuming that this command has been applied successfully, the copy of the certificate file will be applied automatically to the provisioned node.

Once the new device has been resurrected on the network and the certificate file has been downloaded to the provisioned node, the hidden copy of the certificate file is deleted from AMF backup media.

Use the **no** variant of this command to set it back to the default.

This command can only be run on AMF master nodes.

**Syntax** `license-cert <file-path|URL>`  
`no license-cert`

Parameter	Description
<code>&lt;file-path URL&gt;</code>	The name of the certificate file. This can include the file-path of the file.

**Default** No license certificate file is specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network. It will only operate if the provisioned node specified in the command has already been set up, and if the license certification is present in the backup file. Otherwise, an error message is shown when the command is run.

**Example 1** To apply the license certificate 'cert1.txt' stored on a TFTP server for AMF provisioned node "device2", use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# license-cert
tftp://192.168.1.1/cert1.txt
```

**Example 2** To apply the license certificate 'cert2.txt' stored in the AMF master's flash directory for AMF provisioned node 'host2', use the command:

```
device1# atmf provision node host2
device1(atmf-provision)# license-cert /cert2.txt
```

To confirm that the license certificate has been applied to the provisioned node, use the command `show atmf provision nodes`. The output from this command is shown below, and displays license certification details in the last line.

Figure 62-7: Sample output from the `show atmf provision nodes` command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media: SD (Total 3827.0MB, Free 3481.1MB)

Node Name : device2
Date & Time : 06-Oct-2016 & 23:25:44
Provision Path : card:/atmf/nodes

Boot configuration :
Current boot image : x510-5.4.6-1.4.rel (file exists)
Backup boot image : x510-5.4.6-1.3.rel (file exists)
Default boot config : flash:/default.cfg (file exists)
Current boot config : flash:/abc.cfg (file exists)
Backup boot config : flash:/xyz.cfg (file exists)

Software Licenses :
Repository file : ../configs/.sw_v2.lic

  - [locate \(amf-provision\)](#)
  - [show atmf provision nodes](#)

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# locate (amf-provision)

**Overview** This command changes the present working directory to the directory of a provisioned node. This makes it easier to edit files and create a unique provisioned node in the backup.

This command can only be run on AMF master nodes.

**NOTE:** We advise that after running this command, you return to a known working directory, typically flash.

**Syntax** locate

**Mode** AMF Provisioning

**Example** To change the working directory that happens to be on device1 to the directory of provisioned node device2, use the following command:

```
device1# atmf provision node device2
device1[atmf-provision]# locate
```

The directory of the node device2 should now be the working directory. You can use the command `pwd` to check this, as shown in the following figure.

Figure 62-8: Sample output from the `pwd` command

```
device2#pwd
card:/atmf/building_2/nodes/device2/flash
```

The output above shows that the working directory is now the flash of device2.

**Related commands**

- configure boot config (amf-provision)
- configure boot system (amf-provision)
- copy (amf-provision)
- create (amf-provision)
- delete (amf-provision)
- identity (amf-provision)
- license-cert (amf-provision)
- locate (amf-provision)
- pwd
- show atmf provision nodes

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# log event-host

**Overview** Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

**Syntax** `log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`  
`no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	ipv4 address of the event host
<code>&lt;ipv6-addr&gt;</code>	ipv6 address of the event host

**Default** Log events are disabled by default.

**Mode** Global Configuration

**Usage notes** Event hosts are set so syslog sends the messages out as they come.

Note that there is a difference between log event and log host messages:

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

**Example** To enable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

**Related commands** [atmf topology-gui enable](#)

# login-fallback enable

**Overview** Use this command to enable login fallback on TQ model AMF guest nodes. This allows AMF to try the factory default username and password if the guest node's saved username and password fail.

Use the **no** variant of this command to disable login fallback.

**Syntax** login-fallback enable  
no login-fallback enable

**Default** Disabled

**Mode** AMF Guest Configuration

**Usage notes** This feature is only supported on TQ model guest nodes.

Login fallback means: if a guest node's saved username and password fail, AMF will try to connect to the node using the factory default username and password (manager/friend). When a new TQ replaces an existing TQ, this allows the new TQ to be discovered and managed as an AMF guest node. AMF can then start the AMF guest node recovery procedure.

**Example** To use the login fallback feature, first create an AMF guest class for TQ model APs. Then enable the login fall back feature.

For example, to enable login fallback on the guest-class AT-TQ5k, use the commands:

```
node1#configuration terminal
node1(config)#atmf guest-class AT-TQ5k
node1(config-atmf-guest)#login-fallback enable
node1(config-atmf-guest)#end
node1#
```

**Related commands** [atmf guest-class](#)  
[modeltype](#)  
[switchport atmf-guestlink](#)  
[show atmf links guest](#)

**Command changes** Version 5.5.0-1.1: command added

# modeltype

**Overview** This command sets the expected model type of the guest node. The model type will default to **other** if nothing is set.

Use the **no** variant of this command to reset the model type to **other**.

**Syntax** `modeltype {alliedware|aw+|onvif|tq|other}`  
`no modeltype`

Parameter	Description
alliedware	A legacy Allied Telesis operating system.
aw+	The Allied Telesis AlliedWare Plus operating system.
onvif	ONVIF (Open Network Video Interface Forum) Profile Q devices
tq	An Allied Telesis TQ Series wireless access point.
other	Used where the model type is outside the above definitions.

**Default** Default to **other**

**Mode** AMF Guest Configuration

**Examples** To assign the model type **tq** to the guest-class called 'tq\_device', use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# modeltype tq
```

To remove the model type **tq** from the guest-class called 'tq\_device', and reset it to the default of **other**, use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# no modeltype
```

**Related commands** [atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf links guest](#)

**Command changes** Version 5.4.9-2.1: **onvif** parameter added

# service atmf-application-proxy

**Overview** Use this command to enable the AMF Application Proxy service. This service distributes messages across all AMF nodes.

Currently this is used for threat protection. When an AMF Security (AMF-Sec) Controller detects a threat, it issues a request to block the address the threat originated from. The AMF Application Proxy service distributes this message to all AMF nodes. An AMF master accepts this block request and instructs the subordinate AMF node to block the relevant device.

Use the **no** variant of this command to disable the AMF Application Proxy service.

**Syntax** `service atmf-application-proxy`  
`no service atmf-application-proxy`

**Default** The AMF Application Proxy service is disabled by default.

**Mode** Global Configuration

**Usage notes** The AMF master maintains a list of all threats and will send this list to any AMF node, or VCS member, when it boots and joins the AMF network.

In order for this to work the follow must be configured:

- the AMF Application Proxy service on all AMF nodes that need to receive the messages.
- the Hypertext Transfer Protocol (HTTP) service on all nodes that are running the AMF Application Proxy service (see [service http](#)).

**Example** To enable the AMF Application Proxy service, use the commands

```
awplus# configure terminal
awplus(config)# service atmf-application-proxy
```

To disable the AMF Application Proxy service, use the commands

```
awplus# configure terminal
awplus(config)# no service atmf-application-proxy
```

# show application-proxy threat-protection

**Overview** Use this command to list all the IP addresses blocked by the AMF Application Proxy service. It also shows the global threat-detection configuration.

**Syntax** `show application-proxy threat-protection [all]`

Parameter	Description
all	Include information for non-local blocks.

**Mode** Privileged Exec

**Example** To list the addresses blocked by the AMF Application Proxy service, use the command:

```
awplus# show application-proxy threat-protection
```

**Output** Figure 62-9: Example output from **show application-proxy threat-protection**

```
awplus#show application-proxy threat-protection
Quarantine Vlan : vlan200
Global IP-Filter : Enabled
IP-Filter Limit Exceeded : 0
Redirect-URL : http://my.dom/help.html

# show application-proxy whitelist interface

**Overview** Use this command to display the status of port authentication on the specified interface.

**Syntax** `show application-proxy whitelist interface [<interface-list>]`

Parameter	Description
<code>&lt;interface-list&gt;</code>	<p>The interfaces or ports to display information about. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> <p>The specified interface must exist.</p>

**Mode** Privileged Exec

**Example** To display the port authentication information for all interfaces, use the command:

```
awplus# show application-proxy whitelist interface
```

To display the port authentication information for port1.0.4, use the command

```
awplus# show application-proxy whitelist interface port1.0.4
```

**Output** Figure 62-11: Example output from **show application-proxy whitelist interface**

**Command changes** Version 5.4.9-0.1: command added

# show application-proxy whitelist server

**Overview** Use this command to display the external RADIUS server details for the application-proxy whitelist feature.

**Syntax** `show application-proxy whitelist server`

**Mode** Privileged Exec

**Example** To display the external RADIUS server details for the application-proxy whitelist feature, use the command:

```
awplus# show application-proxy whitelist server
```

**Output** Figure 62-12: Example output from **show application-proxy whitelist server**

```
awplus#show application-proxy whitelist server

Application Proxy Whitelist Details:

External Server Details:
 IP: 192.168.1.10
 Port: 2083
 Protection: TLS
 Trustpoint: None (Authentication disabled)

Proxy Details:
 IP: 172.31.0.5
 Status: Alive
```

**Command changes** Version 5.4.9-0.1: command added

# show application-proxy whitelist supplicant

**Overview** Use this command to display the current configuration and status for each supplicant attached to an application-proxy whitelist port.

**Syntax** `show application-proxy whitelist supplicant [interface <interface-list>|<mac-addr>|brief]`

Parameter	Description
<code>interface</code> <interface-list>	The interfaces or ports to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> The specified interface must exist.
<mac-addr>	MAC (hardware) address of the supplicant. Entry format is HHHH.HHHH.HHHH (hexadecimal)
<code>brief</code>	Brief summary of the supplicant state.

**Mode** Privileged Exec

**Example** To display the supplicant information for all ports, use the command:

```
awplus# show application-proxy whitelist supplicant
```

To display the supplicant information for port1.0.4, use the command:

```
awplus# show application-proxy whitelist supplicant interface
port1.0.4
```

**Output** Figure 62-13: Example output from **show application-proxy whitelist supplicant**

```
awplus#show application-proxy whitelist supplicant
Interface port1.0.4
 authenticationMethod: dot1x/mac/web

**Command changes** Version 5.4.9-0.1: command added

# show atmf

**Overview** Displays information about the current AMF node.

**Syntax** `show atmf [summary|tech|nodes|session]`

Parameter	Description
summary	Displays summary information about the current AMF node.
tech	Displays global AMF information.
nodes	Displays a list of AMF nodes together with brief details.
session	Displays information on an AMF session.

**Default** Only summary information is displayed.

**Mode** User Exec and Privileged Exec

**Usage notes** AMF uses internal VLANs to communicate between nodes about the state of the AMF network. Two VLANs have been selected specifically for this purpose. Once these have been assigned, they are reserved for AMF and cannot be used for other purposes

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Example 1** To show summary information on AMF node\_1 use the following command:

```
node_1# show atmf summary
```

**Table 63:** Output from the **show atmf summary** command

```
node_1#show atmf summary
ATMF Summary Information:

ATMF Status : Enabled
Network Name : Test_network
Node Name : node_1
Role : Master
Restricted login : Disabled
Current ATMF Nodes : 3
```

**Example 2** To show information specific to AMF nodes use the following command:

```
node_1# show atmf nodes
```

**Example 3** The **show amf session** command displays all CLI (Command Line Interface) sessions for users that are currently logged in and running a CLI session.

To display AMF active sessions, use the following command:

```
node_1# show atmf session
```

For example, in the output below, node\_1 and node\_5 have active users logged in.

**Table 64:** Output from the **show atmf session** command

```
node_1#show atmf session

CLI Session Neighbors

Session ID : 73518
Node Name : node_1

```

**Example 4** The AMF tech command collects all the AMF commands, and displays them. You can use this command when you want to see an overview of the AMF network.

To display AMF technical information, use the following command:

```
node_1# show atmf tech
```

**Table 65:** Output from the **show atmf tech** command

```

node_1#show atmf tech

```

**Table 66:** Parameter definitions from the **show atmf tech** command

Parameter	Definition
ATMF Status	The Node’s AMF status, either Enabled or Disabled.
Network Name	The AMF network that a particular node belongs to.

**Table 66:** Parameter definitions from the **show atmf tech** command (cont.)

Parameter	Definition
Node Name	The name assigned to a particular node.
Role	The role configured for this AMF device, either Master or Member.
Current ATMF Nodes	The count of AMF nodes in an AMF Network.
Node Address	An address used to access a remotely located node (.atmf).
Node ID	A unique identifier assigned to a Node on an AMF network.
Node Depth	The number of nodes in path from this node to level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.
Domain State	The state of Node in a Domain in AMF network as Controller/Backup.
Recovery State	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.
Management VLAN	The VLAN created for traffic between Nodes of different domain (up/down links). <ul style="list-style-type: none"> <li>• VLAN ID - In this example VLAN 4092 is configured as the Management VLAN.</li> <li>• Management Subnet - Network prefix for the subnet.</li> <li>• Management IP Address - The IP address allocated for this traffic.</li> <li>• Management Mask - The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>
Domain VLAN	The VLAN assigned for traffic between Nodes of same domain (crosslink). <ul style="list-style-type: none"> <li>• VLAN ID - In this example VLAN 4091 is configured as the domain VLAN.</li> <li>• Domain Subnet. The subnet address used for this traffic.</li> <li>• Domain IP Address. The IP address allocated for this traffic.</li> <li>• Domain Mask. The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>
Device Type	The Product Series name.
ATMF Master	Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).
SC	The device configuration, one of C - Chassis (SBx8100 Series), S - Stackable (VCS) or N - Standalone.
Parent	The node to which the current node has an active uplink.
Node Depth	The number of nodes in the path from this node to the master node.

**Related commands** [show atmf detail](#)

# show atmf area

**Overview** Use this command to display information about an AMF area. On AMF controllers, this command displays all areas that the controller is aware of. On remote AMF masters, this command displays the controller area and the remote local area. On gateways, this command displays the controller area and remote master area.

**Syntax** `show atmf area [detail] [<area-name>]`

Parameter	Description
detail	Displays detailed information
<area-name>	Displays information about master and gateway nodes in the specified area only.

**Mode** Privileged Exec

**Example 1** To show information about all areas, use the command:

```
controller-1# show atmf area
```

The following figure shows example output from running this command on a controller.

**Table 67:** Example output from the **show atmf area** command on a Controller.

```
controller-1#show atmf area

ATMF Area Information:

* = Local area

Area Area Local Remote Remote Node
Name ID Gateway Gateway Master Count

* NZ 1 Reachable N/A N/A 3
Wellington 2 Reachable Reachable Auth OK 120
Canterbury 3 Reachable Reachable Auth Error -
SiteA-AREA 14 Unreachable Unreachable Unreachable -
Auckland 100 Reachable Reachable Auth Start -
Southland 120 Reachable Reachable Auth OK 54

Area count: 6 Area node count: 177
```

The following figure shows example output from running this command on a remote master.

**Table 68:** Example output from the **show atmf area** command on a remote master.

```

Canterbury#show atmf area

 ATMF Area Information:

 * = Local area

 Area Area Local Remote Remote Node
 Name ID Gateway Gateway Master Count

 NZ 1 Reachable N/A N/A -
 * Canterbury 3 Reachable N/A N/A 40

 Area count: 2 Local area node count: 40

```

**Table 69:** Parameter definitions from the **show atmf area** command

Parameter	Definition
*	Indicates the area of the device on which the command is being run.
Area Name	The name of each area.
Area ID	The ID of the area.
Local Gateway	Whether the local gateway node is reachable or not.
Remote Gateway	Whether the remote gateway node is reachable or not. This is one of the following: <ul style="list-style-type: none"> <li>Reachable, if the link has been established.</li> <li>Unreachable, if a link to the remote area has not been established. This could mean that a port or vlan is down, or that inconsistent VLANs have been configured using the <a href="#">switchport atmf-arealink</a> command.</li> <li>N/A for the area of the controller or remote master on which the command is being run, because the gateway node on that device is local.</li> <li>Auth Start, which may indicate that the area names match on the controller and remote master, but the IDs do not match.</li> <li>Auth Error, which indicates that the areas tried to authenticate but there is a problem. For example, the passwords configured on the controller and remote master may not match, or a password may be missing on the remote master.?</li> <li>Auth OK, which indicates that area authentication was successful and you can now use the <a href="#">atmf select-area</a> command.</li> </ul>
Remote Master	Whether the remote master node is reachable or not. This is N/A for the area of the controller or remote master on which the command is being run, because the master node on that device is local.
Node Count	The number of nodes in the area.
Area Count	The number of areas controlled by the controller.
Area Node Count	The total number of nodes in the area.

**Example 2** To show detailed information about the areas, use the command:

```
controller-1# show atmf area detail
```

The following figure shows example output from running this command.

**Table 70:** Output from the **show atmf area detail** command

```
controller-1#show atmf area detail

ATMF Area Detail Information:

Controller distance : 0

Controller Id : 21
Backup Available : FALSE

Area Id : 2

# show atmf area guests

**Overview** This command will display details of all guests that the controller is aware of.

**Syntax** `show atmf area guests [<area-name> [<node-name>]]`

Parameter	Description
<area-name>	The area name for guest information
<node-name>	The name of the node that connects to the guests.

**Default** n/a

**Mode** User Exec/Privileged Exec

**Example 1** To display atmf area guest nodes on a controller, use the command,

```
GuestNode[1]#show atmf area guests
```

**Output** Figure 62-14: Example output from the **show atmf area guests** command

```
main-building Area Guest Node Information:
Device MAC IP/IPv6
Type Address Parent Port Address

- 0008.5d10.7635 x230 1.0.3 192.168.5.4
AT-TQ4600 eccd.6df2.da60 wireless-node1 1.0.4 192.168.5.3
- 0800.239e.f1fe x230 1.0.4 192.168.4.8

main-building guest node count 4

GuestNode[1]#
```

**Table 71:** Parameters in the output from **show atmf area guests** command

Parameter	Description
Device Type	The device type as read from the guest node.
MAC Address	The MAC address of the guest-node
Parent	The device that directly connects to the guest-node
Port	The port number on the parent node that connects to the guest node.
IP/IPv6	The IP or IPv6 address of the guest node.

**Related commands**

- show atmf area
- show atmf area nodes
- show atmf backup guest
- show atmf area guests-detail

# show atmf area guests-detail

**Overview** This command displays the local and remote guest information from an AMF controller.

**Syntax** `show atmf area guests-detail [<area-name> [<node-name>]]`

Parameter	Description
<code>&lt;area-name&gt;</code>	The name assigned to the AMF area. An area is an AMF network that is under the control of an AMF Controller.
<code>&lt;node-name&gt;</code>	The name assigned to the network node.

**Default** n/a.

**Mode** Privileged Exec

**Example** To display detailed information for all guest nodes attached to “node1”, which is located within the area named “northern”, use the following command:

```
AMF_controller#show atmf area guests-detail northern node1
```

**Output** Figure 62-15: Example output from the **show atmf guest detail** command.

```
#show atmf guest detail

Node Name : Node1
Port Name : port1.0.5
Ifindex : 5005
Guest Description : tq4600

IPv6 Address : Not Set
HTTP Port : 80
Firmware Version :
```

**Table 72:** Parameters shown in the output of the **show atmf guest detail** command

Parameter	Description
Node Name	The name of the guest's parent node.
Port Name	The port on the parent node that connects to the guest.
IFindex	An internal index number that maps to the port number on the parent node.
Guest Description	A brief description of the guest node as manually entered into the <a href="#">description (interface)</a> command for the guest node port on the parent node.
Device Type	The device type as supplied by the guest node itself.
Backup Supported	Indicates whether AMF supports backup of this guest node.
MAC Address	The MAC address of the guest node.
IP Address	The IP address of the guest node.
IPv6 Address	The IPv6 address of the guest node.
HTTP Port	The HTTP port enables you to specify a port when enabling http to allow a URL for the http user interface of a Guest Node. This is determined by the <a href="#">http-enable</a> command.
Firmware Version	The firmware version that the guest node is currently running.

**Related commands** [show atmf area nodes-detail](#)  
[show atmf area guests](#)

# show atmf area nodes

**Overview** Use this command to display summarized information about an AMF controller’s remote nodes.

Note that this command can only be run from a controller node.

**Syntax** `show atmf area nodes <area-name> [<node-name>]`

Parameter	Description
<area-name>	Displays information about nodes in the specified area.
<node-name>	Displays information about the specified node.

**Mode** Privileged Exec

**Usage notes** If you do not limit the output to a single area or node, this command lists all remote nodes that the controller is aware of. This can be a very large number of nodes.

**Example** To show summarized information for all the nodes in area ‘Wellington’, use the command:

```
controller-1# show atmf area nodes Wellington
```

The following figure shows partial example output from running this command.

**Table 73:** Output from the **show atmf area nodes Wellington** command

```

controller-1#show atmf area nodes Wellington

Wellington Area Node Information:
Node Device ATMF Parent Node
Name Type Master SC Domain Depth

well-gate x230-18GP N N well-master 1
well-master AT-x930-28GPX Y N none 0

Wellington node count 2

```

**Table 74:** Parameter definitions from the **show atmf area nodes** command

Parameter	Definition
Node Name	The name assigned to a particular node.
Device Type	The Product series name.
ATMF Master	Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).

**Table 74:** Parameter definitions from the **show atmf area nodes** command

Parameter	Definition
SC	The device configuration, one of C - Chassis (SBx8100 series), S - Stackable (VCS) or N - Standalone.
Parent Domain	The node to which the current node has an active uplink.
Node Depth	The number of nodes in the path from this node to the master node.

**Related  
commands**

[show atmf area nodes](#)

# show atmf area summary

**Overview** Use this command to display a summary of IPv6 addresses used by AMF, for one or all of the areas controlled by an AMF controller.

**Syntax** `show atmf area summary [<area-name>]`

Parameter	Description
<code>&lt;area-name&gt;</code>	Displays information for the specified area only.

**Mode** Privileged Exec

**Example 1** To show a summary of IPv6 addresses used by AMF, for all of the areas controlled by controller-1, use the command:

```
controller-1# show atmf area summary
```

The following figure shows example output from running this command.

**Table 77:** Output from the **show atmf area summary** command

```
controller-1#show atmf area summary

ATMF Area Summary Information:

Management Information
Local IPv6 Address : fd00:4154:4d46:1::15

Area Information

# show atmf authorization

**Overview** Use this command on an AMF master to display the authorization status of other AMF members and masters on the network.

On an AMF controller this command will show the authorization status of remote area AMF masters.

**Syntax** `show atmf authorization {current|pending|provisional}`

Parameter	Description
current	Show the status of all authorized nodes.
pending	Show the status of unauthorized nodes in the pending queue. These are nodes that enabled secure mode with <code>atmf secure-mode</code> but have not yet been authorized with <code>atmf authorize</code> .
provisional	Show the status of provisionally authorized nodes. These are nodes that have been provisioned with <code>atmf authorize provision</code> .

**Mode** Privileged Exec

**Example** To display all authorized AMF nodes on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization current
```

To display AMF nodes which are requesting authorization on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization pending
```

To display AMF nodes which have provisional authorization, use the command:

```
awplus# show atmf authorization provisional
```

**Output** Figure 62-16: Example output from `show atmf authorization current`

NZ Authorized Nodes:		
Node Name	Signer	Expires
-----	-----	-----
master_1	master_1	4 Mar 2017
area_1_node_1	master_1	4 Mar 2017
area_1_node_2	master_1	4 Mar 2017

Table 62-1: Parameters in the output from **show atmf authorization current**

Parameter	Description
Node Name	AMF node name of the authorized node.
Signer	Name of the AMF master that authorized the node.
Expires	Expiry date of the authorization. Authorization expiry time is set using <code>atmf secure-mode certificate expiry</code> .

**Output** Figure 62-17: Example output from **show atmf authorization pending**

```

Pending Authorizations:

NZ Requests:

Version 5.4.7-0.3: command added

# show atmf backup

**Overview** This command displays information about AMF backup status for all the nodes in an AMF network. It can only be run on AMF master and controller nodes.

**Syntax**

```
show atmf backup
show atmf backup logs
show atmf backup server-status
show atmf backup synchronize [logs]
```

Parameter	Description
logs	Displays detailed log information.
server-status	Displays connectivity diagnostics information for each configured remote file server.
synchronize	Display the file server synchronization status
logs	For each remote file server, display the logs for the last synchronization

**Mode** Privileged Exec

**Example 1** To display the AMF backup information, use the command:

```
node_1# show atmf backup
```

To display log messages to do with backups, use the command:

```
node_1# show atmf backup logs
```

Table 62-4: Output from **show atmf backup**

```
Node_1# show atmf backup
ScheduledBackupEnabled
 Schedule.....1 per day starting at 03:00
 Next Backup Time....04 May 2019 03:00
Backup BandwidthUnlimited

 2019/05/04 22:25:54 [8039] sent 46 bytes received 39 bytes total size 40
```

**Example 3** To display the AMF backup information with the optional parameter **server-status**, use the command:

```
Node_1# show atmf backup server-status
```

```

Node1#sh atmf backup server-status

Id Last Check State

1 186 s File server ready
2 1 s SSH no route to host

```

**Table 63:** Parameter definitions from the **show atmf backup** command

Parameter	Definition
Scheduled Backup	Indicates whether AMF backup scheduling is enabled or disabled.
Schedule	Displays the configured backup schedule.
Next Backup Time	Displays the date and time of the next scheduled.
Backup Media	The current backup medium in use. This will be one of USB, SD, or NONE. Utilized and available memory (MB) will be indicated if backup media memory is present.
Current Action	The task that the AMF backup mechanism is currently performing. This will be a combination of either (Idle, Starting, Doing, Stopping), or (manual, scheduled).
Started	The date and time that the currently executing task was initiated in the format DD MMM YYYY HH:MM
Current Node	The name of the node that is currently being backed up.
Backup Redundancy	Whether backup redundancy is enabled or disabled.
Local media	The local media to be used for backup redundancy; SD, USB, INTERNAL, or NONE, and total and free memory available on the media.
State	Whether SD or USB media is installed and available for backup redundancy. May be Active (if backup redundancy is functional—requires both the local redundant backup media and a remote server to be configured and available) or Inactive.
Node Name	The name of the node that is storing backup data - on its backup media.
Date	The data of the last backup in the format DD MMM YYYY.
Time	The time of the last backup in the format HH:MM:SS.
In ATMF	Whether the node shown is active in the AMF network, (Yes or No).
On Media	Whether the node shown has a backup on the backup media (Yes or No).

**Table 63:** Parameter definitions from the **show atmf backup** command (cont.)

Parameter	Definition
Status	The output can contain one of four values: <ul style="list-style-type: none"><li>• “-” meaning that the status file cannot be found or cannot be read.</li><li>• “Errors” meaning that there are issues - note that the backup may still be deemed successful depending on the errors.</li><li>• “Stopped” meaning that the backup attempt was manually aborted.</li><li>• “Good” meaning that the backup was completed successfully.</li><li>• “In Progress” meaning that the backup is currently running on that node.</li></ul>
Log File Location	All backup attempts will generate a result log file in the identified directory based on the node name. In the above example this would be: card:/amf/office/logs/rsync_amf_testbox1.log.
Log Details	The contents of the backup log file.
server-status	Displays connectivity diagnostics information for each configured remove file server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

[atmf network-name](#)

# show atmf backup area

**Overview** Use this command to display backup status information for the master nodes in one or more areas.

Note that this command is only available on AMF controllers.

**Syntax** `show atmf backup area [<area-name> [<node-name>]] [logs]`

Parameter	Description
logs	Displays the logs for the last backup of each node.
<area-name>	Displays information about nodes in the specified area.
<node-name>	Displays information about the specified node.

**Mode** Privileged Exec

**Example** To show information about backups for an area, use the command:

```
controller-1# show atmf backup area
```

**Table 64:** Output from the **show atmf backup area** command

```

# show atmf backup guest

**Overview** This command displays backup status information of guest nodes in an AMF network. This command can only be run on a device configured as an AMF Master and has an AMF guest license.

**Syntax** `show atmf backup guest [<node-name> [<guest-port>]] [logs]`

Parameter	Description
<code>&lt;node-name&gt;</code>	The name of parent guest node
<code>&lt;guest-port&gt;</code>	The port number on the parent node

**Mode** User Exec/Privileged Exec

**Example** On the switch named x930-master, to display information about the AMF backup guest status, use the command:

```
x930-master# show atmf backup guest
```

**Output** Figure 62-19: Example output from **show atmf backup guest**

		1	19 Jan 2016	22:21:46	Good
		USB	19 Jan 2016	22:21:46	Good

Table 62-1: Parameters in the output from **show atmf backup guest**

Parameter	Description
Guest Backup	The status of the guest node backup process
Scheduled Backup	The timing configured for guest backups.
Schedule	Displays the configured backup schedule.
Next Backup Time	The time the next backup process will be initiated.
Backup Bandwidth	The bandwidth limit applied to the backup data flow measured in kilo Bytes /second. Note that unlimited means there is no limit set specifically for the backup data flow.
Backup Media	Detail of the memory media used to store the backup files and the current memory capacity available.

# show atmf container

**Overview** Use this command to display information about the AMF containers created on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `show atmf container [detail] [<container-name>]`

Parameter	Description
detail	Show detailed information.
<container-name>	The name of the AMF container you wish to display information for.

**Mode** Privileged Exec

**Output** Figure 62-20: Example output from **show atmf container**

```
awplus#show atmf container
ATMF Container Information:
 Container Area Bridge State Memory CPU%

 vac-wlg-1 wlg br1 running 70.3 MB 1.2
 vac-akl-1 ak1 br2 stopped 0 bytes 0.0
 vac-nsn-1 nsn br3 running 53.2 MB 0.7
Current ATMF Container count: 3
```

Figure 62-21: Example output from **show atmf container vac-wlg-1**

```
awplus#show atmf container vac-wlg-1
ATMF Container Information:
 Container Area Bridge State Memory CPU%

 vac-wlg-1 wlg br1 running 70.3 MB 1.2
Current ATMF Container count: 1
```

Table 62-2: Parameters in the output from **show atmf container**

Parameter	Description
Container	Name of the AMF container.
Area	Name of the area the container is in.
Bridge	Name of the bridge connecting the container to the physical network.
State	Container state, <code>running</code> or <code>stopped</code> . This is set with the <code>state</code> command.
Memory	The amount of memory the container is using on the VAA host.
CPU%	The percentage of CPU time the container is using on the VAA, at the time the show command is run.

Figure 62-22: Example output from **show atmf container detail vac-wlg-1**

```
awplus#show atmf container detail vac-wlg-1

ATMF Container Information:

Name: vac-wlg-1
State: RUNNING
PID: 980
IP: 172.31.0.1
IP: 192.168.0.2
IP: fd00:4154:4d46:3c::1
CPU use: 3.95 seconds
Memory use: 67.07 MiB
Memory use: 0 bytes
Link: vethP31UFA
TX bytes: 166.01 KiB
RX bytes: 141.44 KiB
Total bytes: 307.45 KiB
Link: vethYCT7BB
TX bytes: 674.27 KiB
RX bytes: 698.27 KiB
Total bytes: 1.34 MiB
```

Table 62-3: Parameters in the output from **show atmf container detail**

Parameter	Description
Name	Name of the AMF container.
State	Container state, <code>RUNNING</code> or <code>STOPPED</code> . This is set with the <code>state</code> command.

Table 62-3: Parameters in the output from **show atmf container detail** (cont.)

Parameter	Description
PID	Internal container id.
IP	This lists the IP addresses used by the container. These include the eth1 IP address and the AMF management IP address.
CPU use	The CPU usage of the container since it was enabled.
Memory use	Container memory usage.
Link	Each container has two links: <ol style="list-style-type: none"><li>1 An AMF area-link, this connects the container to the AMF controller and uses virtual interface eth0 on the AMF container.</li><li>2 A bridged L2 network link, this connects the container to the outside world and uses the virtual interface eth1 on the AMF container.</li></ol> See the <a href="#">AMF Feature Overview and Configuration_Guide</a> for more information on these links.
TX/RX bytes	Bytes sent and received on a link.
Total bytes	Total bytes transferred on a link.

**Command changes**

Version 5.4.7-0.1: command added

# show atmf detail

**Overview** This command displays details about an AMF node. It can only be run on AMF master and controller nodes.

**Syntax** show atmf detail

Parameter	Description
detail	Displays output in greater depth.

**Mode** Privileged Exec

**Example 1** To display the AMF node1 information in detail, use the command:

```
controller-1# show atmf detail
```

A typical output screen from this command is shown below:

```
atmf-1#show atmf detail
ATMF Detail Information:

Network Name : Test_network
Network Mtu : 1300
Node Name : controller-1
Node Address : controller-1.atmf
Node ID : 342
Node Depth : 0
Domain State : BackupDomainController
Recovery State : None
Recovery Over ETH Ports : Disabled
Log Verbose Setting : Verbose
Topology GUI : Disabled

Management VLAN
VLAN ID : 4000
Management Subnet : 172.31.0.0
Management IP Address : 172.31.1.86
Management Mask : 255.255.128.0
Management IPv6 Address : fd00:4154:4d46:1::156
Management IPv6 Prefix Length : 64

Domain VLAN
VLAN ID : 4091
Domain Subnet : 172.31.128.0
Domain IP Address : 172.31.129.86
Domain Mask : 255.255.128.0
```

**Table 63:** Parameter definitions from the **show atmf detail** command

Parameter	Definition
Network MTU	The network MTU for the ATMF network.
Network Name	The AMF network that a particular node belongs to.
Node Name	The name assigned to a particular node.
Node Address	An address used to access a remotely located node. This is simply the Node Name plus the dotted suffix atmf (.atmf).
Node ID	A unique identifier assigned to a node on an AMF network.
Node Depth	The number of nodes in the path from this node to the level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.
Domain State	The state of a node in a Domain in an AMF network as Controller/Backup.
Recovery State	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.
Recovery Over ETH Ports	Allow AMF recovery over the Eth port on an AR-series device.
Log Verbose Setting	The state of the <code>atmf log-verbose</code> command.
Topology GUI	This feature allows your AMF network to interact with Vista Manager EX and must be enabled on your AMF master.
Management VLAN	The VLAN created for traffic between nodes of different domain (up/down links). <ul style="list-style-type: none"> <li>• VLAN ID - in this example VLAN 4092 is configured as the Management VLAN.</li> <li>• Management Subnet - the network prefix for the subnet.</li> <li>• Management IP Address - the IP address allocated for this traffic.</li> <li>• Management Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>
Domain VLAN	The VLAN assigned for traffic between nodes of the same domain (crosslink). <ul style="list-style-type: none"> <li>• VLAN ID - in this example VLAN 4091 is configured as the domain VLAN.</li> <li>• Domain Subnet - the subnet address used for this traffic.</li> <li>• Domain IP Address - the IP address allocated for this traffic.</li> <li>• Domain Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>
Node Depth	The number of nodes in the path from this node to the core domain.

# show atmf group

**Overview** This command can be used to display the group membership within to a particular AMF node. It can also be used with the working-set command to display group membership within a working set.

Each node in the AMF is automatically added to the group that is appropriate to its hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group.

You can create arbitrary groups of AMF members based on your own selection criteria. You can then assign commands collectively to any of these groups.

**Syntax** `show atmf group [user-defined|automatic]`

Parameter	Description
<code>user-defined</code>	User-defined-group information display.
<code>automatic</code>	Automatic group information display.

**Default** All groups are displayed

**Mode** Privileged Exec

**Example 1** To display group membership of node2, use the following command:

```
node2# show atmf group
```

A typical output screen from this command is shown below:

```
ATMF group information

master, x510

node2#
```

This screen shows that node2 contains the groups **master** and **x510**. Note that although the node also contains the implicit groups, these do not appear in the show output.

**Example 2** The following commands (entered on *node2*) will display all the automatic groups within the working set containing *node1* and all nodes that have been pre-defined to contain the *sysadmin* group:

First define the working-set:

```
node1# #atmf working-set node1 group sysadmin
```

A typical output screen from this command is shown below:

```

ATMF group information

master, poe, x8100

=====
node1, node2, node3, node4, node5, node6:
=====

ATMF group information

sysadmin, x8100

AMF_NETWORK[6]#

```

This confirms that the six nodes (*node1* to *node6*) are now members of the working-set and that these nodes reside within the *AMF-NETWORK*.

Note that to run this command, you must have previously entered the command [atmf working-set](#) on page 3188. This can be seen from the network level prompt, which in this case is *AMF\_NETWORK[6]#*.

**Table 64:** Sample output from the **show atmf group** command for a working set.

```

AMF_NETWORK[6]#show atmf group
=====
node3, node4, node5, node6:
=====

ATMF group information

edge_switches, x510

```

**Table 65:** Parameter definitions from the **show atmf group** command for a working set

Parameter	Definition
ATMF group information	Displays a list of nodes and the groups that they belong to, for example: <ul style="list-style-type: none"> <li>• master - Shows a common group name for Nodes configured as AMF masters.</li> <li>• Hardware Arch - Shows a group for all Nodes sharing a common Hardware architecture, e.g. x8100, x230, for example.</li> <li>• User-defined - Arbitrary groups created by the user for AMF nodes.</li> </ul>

# show atmf group members

**Overview** This command will display all group memberships within an AMF working-set. Each node in the AMF working set is automatically added to automatic groups which are defined by hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group. Users can define arbitrary groupings of AMF members based on their own criteria, which can be used to select groups of nodes.

**Syntax** `show atmf group members [user-defined|automatic]`

Parameter	Description
user-defined	User defined group membership display.
automatic	Automatic group membership display.

**Mode** Privileged Exec

**Example** To display group membership of all nodes in a working-set, use the command:

```
ATMF_NETWORK[9]# show atmf group members
```

**Table 66:** Sample output from the **show atmf group members** command

```
ATMF Group membership
Automatic Total
Groups Members Members

master 1 Building_1
poe 1 HW_Team1
x510 3 SW_Team1 SW_Team2 SW_Team3
x930 1 HW_Team1
x8100 2 Building_1 Building_2

ATMF Group membership
User-defined Total
Groups Members Members

marketing 1 Bld1_Floor_1
software 3 SW_Team1 SW_Team2 SW_Team3
```

**Table 67:** Parameter definitions from the **show atmf group members** command

Parameter	Definition
Automatic Groups	Lists the Automatic Groups and their nodal composition. The sample output shows AMF nodes based on the same Hardware type or belonging to the same Master group.
User-defined Groups	Shows the grouping of AMF nodes in user defined groups.
Total Members	Shows the total number of members in each group.
Members	Shows the list of AMF nodes in each group.

**Related commands**

- [show atmf group](#)
- [show atmf](#)
- [atmf group \(membership\)](#)

# show atmf guests

**Overview** This command is available on any AMF master or controller in the network. It displays a summary of the AMF guest nodes that exist in the AMF network, including device type, parent node, and IP address.

**Syntax** show atmf guests

**Mode** User Exec/Privileged Exec

**Usage notes** Use this command to display all guest nodes in a network. If you want to see only the guests attached to a single node, use the [show atmf links guest](#) command, which shows information about the guest nodes and also about their link to their parent node.

**Example** To display the AMF guest output, use the command:

```
awplus# show atmf guests
```

**Output** Figure 62-23: Example output from the **show atmf guests** command

```
master#show atmf guests

Guest Information:

Device Device Parent Guest IP/IPv6
Name Type Node Port Address

node1-2.0.1 x600-24Ts node1 2.0.1 192.168.2.10
wireless-zone1 AT-TQ4600 node2 1.0.1 192.168.1.10
wireless-zone2 AT-TQ4600 node2 1.0.2 192.168.1.12

Current ATMF guest node count 3
```

**Table 68:** Parameters shown in the output of the **show atmf guests** command

Parameter	Description
Device Name	The name that is discovered from the device, or failing that, a name that is auto-assigned by AMF. The auto-assigned name consists of: <parent node name>-<attached port number> You can change this by configuring a description on the port.
Device Type	The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command.

**Table 68:** Parameters shown in the output of the **show atmf guests** command

Parameter	Description
Parent Node	The name of the AMF node that directly connects to the guest node.
Guest Port	The port on the parent node that directly connects to the guest node.
IP/IPv6 Address	The address discovered from the node, or statically configured on the parent node's attached port.

**Related  
commands**

[atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf backup guest](#)  
[show atmf links guest](#)

# show atmf guests detail

**Overview** This command is available on any AMF master in the network. It displays details about the AMF guest nodes that exist in the AMF network, such as device type, IP address, MAC address etc.

**Syntax** `show atmf guests detail [<node-name>] [<guest-port>]`

Parameter	Description
<code>&lt;node-name&gt;</code>	The name of the guest node's parent.
<code>&lt;guest-port&gt;</code>	The port name on the parent node.

**Mode** User Exec/Privileged Exec

**Usage notes** If you want to see only the guests attached to a single node, you can use either:

- this command and specify the node name, or
- [show atmf links guest detail](#), which shows information about the guest nodes and also about their link to their parent node.

Note that the parameters that are displayed depend on the guest node's model.

**Example** To display the AMF guest output, use the command:

```
awplus# show atmf guests detail
```

**Output** Figure 62-24: Example output from **show atmf guests detail**

```
master#show atmf guests detail

ATMF Guest Node Information:

Node Name : master
Port Name : port1.0.9
Ifindex : 5009
Guest Description : red-1.0.9
Device Type : x600-24Ts
Backup Supported : No
MAC Address : 0000.cd38.0c4d
IP Address : 192.168.1.5
IPv6 Address : Not Set
HTTP Port : 0
Firmware Version : 5.4.2-0.1
```

Node Name	: node1
Port Name	: port1.0.13
Ifindex	: 5013
Guest Description	: node1-1.0.13
Device Type	: AT-TQ4600
Backup Supported	: Yes
MAC Address	: eccd.6df2.daa0
IP Address	: 192.168.5.6
IPv6 Address	: Not Set
HTTP Port	: 80
Firmware Version	: 3.1.0 B01

**Table 69:** Parameters in the output from **show atmf guests detail**.

Parameter	Description
Node Name	The name of the parent node, which is the AMF node that directly connects to the guest node.
Port Name	The port on the parent node that connects to the guest.
IfIndex	An internal index number that maps to the port number on the parent node.
Guest Description	A description that is discovered from the device, or failing that, auto-assigned by AMF. The auto-assigned name consists of: <parent node name>-<attached port number>. You can change this by configuring a description on the port.
Device Type	The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command.
Username	The user name configured on the guest node.
Backup Supported	Whether the guest node supports AMF backup functionality.
MAC Address	The MAC address of the guest node.
IP Address	The IP address of the guest node.
IPv6 Address	The IPv6 address of the guest node.
Firmware Version	The version of the firmware operating on the guest node.
HTTP port	The HTTP port as specified with the <a href="#">http-enable</a> command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).

**Related  
commands**    `atmf guest-class`  
                  `switchport atmf-guestlink`  
                  `show atmf backup guest`

# show atmf links

**Overview** This command displays information about AMF links on a switch. The display output contains link status state information.

**Syntax** `show atmf links [brief]`

Parameter	Description
brief	A brief summary of AMF links, their configuration and status.

**Mode** User Exec and Privileged Exec

**Usage notes** The **show atmf links** and **show atmf links brief** commands both produce a table of summarized link information. For a more detailed view use the [show atmf links detail](#) command.

This command does not show links that are configured on provisioned ports.

**Example** To display a brief summary of the AMF links, use the following command:

```
node-1# show atmf links brief
```

Figure 62-25: Example output from **show atmf links brief**

```
Example-core# show atmf links

ATMF Link Brief Information:

Local Link Link ATMF Adjacent Adjacent Link
Port Type Status State Node Ifindex State

1.0.10 Crosslink Down Init *crosslink1 - Blocking
1.0.14 Crosslink Down Init *crosslink2 - Blocking
1.0.1 Downlink Down Init - - Blocking
1.0.2 Downlink Up Full Node2 5001 Forwarding
1.0.8 Downlink Up Full downlink1 5001 Forwarding

* = Provisioned.
```

Table 62-1: Parameter in the output from **show atmf links brief**

Parameter	Definition
Local Port	Shows the local port on the selected node.
Link Type	Shows link type as Uplink or Downlink (parent and child) or Cross-link (nodes in same domain).
Link Status	Shows the link status of the local port on the node as either Up or Down.

Table 62-1: Parameter in the output from **show atmf links brief** (cont.)

Parameter	Definition
ATMF State	Shows AMF state of the local port: <ul style="list-style-type: none"> <li>• Init - Link is down.</li> <li>• Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable.</li> <li>• Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations.</li> <li>• OneWay - Link is up and has waited the hold down period and now attempting to link to another unit in another domain.</li> <li>• OneWaySim - Device is running in secure mode and link is up but waiting for authorization from an AMF master.</li> <li>• Full - Link hello packets are sent and received from its neighbor with its own node id.</li> <li>• Shutdown - Link has been shut down by user configuration.</li> </ul>
Adjacent Node	Shows the Adjacent AMF Node to the one being configured.
Adjacent IF Index	Shows the IF index for the Adjacent AMF Node connected to the node being configured.
Link State	Shows the state of the AMF link. Valid states are either Forwarding or Blocking.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

# show atmf links detail

**Overview** This command displays detailed information on all the links configured in the AMF network. It can only be run on AMF master and controller nodes.

**Syntax** show atmf links detail

Parameter	Description
detail	Detailed AMF links information.

**Mode** User Exec

**Usage notes** For summarized link information see the [show atmf links](#) command.  
This command does not show links that are configured on provisioned ports.

**Example** To display the AMF link details use this command:

```
device1# show atmf links detail
```

The output from this command will display all the internal data held for AMF links. The following example gives details of the links that are summarized in the example in [show atmf links](#).

**Table 63:** Sample output from the **show atmf links detail** command

```
device1# show atmf links detail

**Related commands** no debug all  
clear atmf links statistics  
show atmf

# show atmf links guest

**Overview** This command displays information about guest nodes visible to an AMF device.

**Syntax** `show atmf links guest [interface <interface-range>]`

Parameter	Description
interface <interface-range>	Select a specific range of ports to display information about guest nodes.

**Default** With no parameters specified this command will display its standard output for all ports with guest nodes connected.

**Mode** User Exec/Privileged Exec

**Usage notes** Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use [show atmf guests](#).

**Example 1** To display information about AMF guests that are connectible from node1, use the command:

```
node1# show atmf links guest
```

**Output** Figure 62-26: Example output from **show atmf links guest**

```
node1#sh atmf links guest

Guest Link Information:

DC = Discovery configuration
S = static D = dynamic

Local Guest Model MAC IP / IPv6
Port Class Type DC Address Address

1.0.2 aastra-phone other D 0008.5d10.7635 192.168.1.3
1.0.3 cisco-phone2 other S - 192.168.2.1
1.0.4 panasonic... other D 0800.239e.f1fe 192.168.1.5
```

Table 62-1: Parameters in the output from **show atmf links guest**

Parameter	Description
Local Port	The port on the parent node that connects to the guest.
Guest Class	The name of the ATMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command.

Table 62-1: Parameters in the output from **show atmf links guest** (cont.)

Parameter	Description
Model Type	The model type of the guest node, as entered by the <code>modeltype</code> command. Can be one of the following: <ul style="list-style-type: none"><li>• alliedware</li><li>• aw+</li><li>• tq</li><li>• other</li></ul>
DC	The discovery method as applied by the <code>discovery</code> command. This can be either dynamic (D) or static (S).
MAC Address	The MAC address of the guest node.
IP / IPv6 Address	The IP address of the guest node.

**Related commands**

# show atmf links guest detail

**Overview** This command displays detailed information about guest nodes visible to an AMF device.

**Syntax** `show atmf links guest detail [interface <interface-range>]`

Parameter	Description
<code>interface</code> <code>&lt;interface-range&gt;</code>	Select a specific range of ports to display information about guest nodes.

**Mode** User Exec and Privileged Exec

**Usage notes** Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use [show atmf guests detail](#).

Note that the parameters that are displayed depend on the guest node's model and state.

**Example** To display detailed information about AMF guests, use the command:

```
node1# show atmf links guest detail
```

**Output** Figure 62-27: Example output from **show atmf links guest detail**

```

node1#show atmf links guest detail

Detailed Guest Link Information:

Interface : port1.0.13
Link State : Down
Class Name : test
Model Type : Other
Discovery Method : Static
IP Address : 192.168.1.13
Node State : Down

Interface : port1.0.5
Link State : Full
Class Name : tq_device
Model Type : TQ
Discovery Method : Dynamic
IP Address : 192.168.1.221
Username : manager
Login Fallback : Yes
Node State : Full
Backup Supported : Yes
MAC address : 001a.ebab.d2e0
Device Type : AT-TQ4600
Description : AP221
Firmware Version : 3.2.1 B02
HTTP port : 80

```

Table 62-2: Parameters in the output from **show atmf links guest detail**

Parameter	Description
Interface	The port on the parent node that connects to the guest.
Link State	The state of the link to the guest node; one of: <ul style="list-style-type: none"> <li>Down: The physical link is down.</li> <li>Up: The physical link has come up, but it is still during a timeout period that is enforced to allow other links to come up.</li> <li>Learn: The timeout period described above has elapsed, and the link is now learning information from the AMF guest node. You can see what information it is learning from the "Node State" field below.</li> <li>Full: The node connected by this link has joined the AMF network.</li> <li>Fail: The port is physically up but something has prevented the guest node from joining the AMF network.</li> </ul>
Class Name	The name of the ATMF guest-class that has been assigned to the guest node by the <code>atmf guest-class</code> command.

Table 62-2: Parameters in the output from **show atmf links guest detail** (cont.)

Parameter	Description
Model Type	The model type of the guest node, as entered by the <code>modeltype</code> command. The mode type can be one of the following: <ul style="list-style-type: none"> <li>• alliedware</li> <li>• aw+</li> <li>• onvif</li> <li>• tq</li> <li>• other</li> </ul>
Discovery Method	The discovery method as applied by the <code>discovery</code> command. This can be either dynamic or static.
IP Address	The IP address of the guest node.
Username	The user name configured on the guest node.
Login Fallback	Whether the guest node supports Login Fallback. For TQ model guest nodes, when login fallback is enabled, if a guest node is replaced, then AMF logs in to the new TQ using the factory default manager/friend settings. The new TQ is then discovered and managed as an AMF guest node by an AMF master or member. This means any backed up settings for the replaced guest node can also be recovered.
Node state	The state of the guest node; one of: <ul style="list-style-type: none"> <li>• Down: The initial state when a link to a guest node is first configured. This is also the state if the physical link goes down.</li> <li>• Getting IP: The AMF device is in the process of retrieving the IP address of the guest node.</li> <li>• Getting Mac: The AMF device is in the process of retrieving the MAC address of the guest node.</li> <li>• Getting Info: The AMF device is in the process of retrieving any other available information from the guest (firmware version etc). The information available depends on what device the guest node is.</li> <li>• Full: The AMF device has retrieved all necessary information and the guest node has joined the AMF network. Once this state is reached, the Link State also changes to "Full".</li> <li>• Failure: The physical link is up but the AMF member has failed to retrieve enough information to allow the guest node to join the AMF network.</li> </ul>
Backup Supported	Whether the guest node supports AMF backup functionality.
MAC Address	The MAC address of the guest node.

Table 62-2: Parameters in the output from **show atmf links guest detail** (cont.)

Parameter	Description
Device Type	Model information for the guest node. This field shows the model information that AMF retrieved from the guest node. In contrast, the Model Type shows what a user entered as the type of device they intended this guest node to be.
Description	By default, this is a concatenation of the guest node's parent node and the port to which it is attached. You can change it by configuring a description on the port.
Serial Number	The serial number of the guest node.
Firmware Name	The name of the firmware operating on the guest node.
Firmware Version	The version of the firmware operating on the guest node.
HTTP port	The HTTP port as specified with the <a href="#">http-enable</a> command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).

**Command changes**

Version 5.5.0-1.1: **Login Fallback** parameter added

# show atmf links statistics

**Overview** This command displays details of the AMF links configured on the device and also displays statistics about the AMF packet exchanges between the devices.

It is also possible to display the AMF link configuration and packet exchange statistics for a specified interface.

This command can only be run on AMF master and controller nodes

**Syntax** `show atmf links statistics [interface [<port-number>]]`

Parameter	Description
interface	Specifies that the command applies to a specific interface (port) or range of ports. Where both the interface and port number are unspecified, full statistics (not just those relating to ports) will be displayed.
<port-number>	Enter the port number for which statistics are required. A port range, a static channel or LACP link can also be specified. Where no port number is specified, statistics will be displayed for all ports on the device.

**Mode** User Exec

**Example 1** To display AMF link statistics for the whole device, use the command:

```
device1# show atmf links statistics
```

**Table 63:** Sample output from the **show atmf links statistics** command

```
ATMF Statistics:
```

Type0 0 : Gateway hello msg received from unexpected neighbor
Type1 0 : Stack hello msg received from unexpected neighbor
Type2 0 : Discard TX update bitmap packet - bad checksum
Type3 0 : Discard TX update packet - neighbor not in correct state
Type4 0 : Discard update packet - bad checksum or type
Type5 0 : Discard update packet - neighbor not in correct state
Type6 0 : Discard update bitmap packet - bad checksum or type
Type7 0 : Incarnation is not possible with the data received
Type8 0 : Discard crosslink hello received - not correct state
Type9 0 : Discard crosslink domain hello received on non crosslink
Type10 0 : Discard crosslink domain hello - not in correct state
Type11 0 : Crosslink uplink hello received on non crosslink port
Type12 0 : Discard crosslink uplink hello - not in correct state
Type13 0 : Wrong network-name for this ATMF
Type14 0 : Packet received on port is too long
Type15 0 : Bad protocol version, received on port
Type16 0 : Bad packet checksum calculation
Type17 0 : Bad authentication type
Type18 0 : Bad simple password
Type19 0 : Unsupported authentication type
Type20 0 : Discard packet - unknown neighbor
Type21 0 : Discard packet - port is shutdown
Type22 0 : Non broadcast hello msg received from unexpected neighbor
Type23 0 : Arealink hello msg received on non arealink port
Type24 0 : Discard arealink hello packet - not in correct state
Type25 0 : Discard arealink hello packet - failed basic processing
Type26 0 : Discard unicast packet - MAC address does not match node
Type27 0 : AMF Master license node limit exceeded

```

**Example 2** To display the AMF links statistics on interface port1.0.4, use the command:

```
device1# show atmf links statistics interface port1.0.4
```

Figure 62-28: Sample output from the **show atmf links statistics** command for interface port1.0.4

```

device1# show atmf links statistics interface port1.0.4

ATMF Port Statistics:

port1.0.4 Crosslink Hello 231 232
port1.0.4 Crosslink Hello Domain 116 116
port1.0.4 Crosslink Hello Uplink 116 115
port1.0.4 Hello Link 0 0
port1.0.4 Arealink Hello 0 0

```

Figure 62-29: Parameter definitions from the **show atmf links statistics** command output

Parameter	Definition
Receive	Shows a count of AMF protocol packets received per message type.
Transmit	Shows the number of AMF protocol packets transmitted per message type.
Database Entries	Shows the number of AMF elements existing in the distributed database.
Database Full Ages	Shows the number of times the entries aged in the database.
ATMF Packet Discards	Shows the number of discarded packets of each type.

# show atmf nodes

**Overview** This command displays nodes currently configured within the AMF network.

Note that the output also tells you whether or not node map exchange is active. Node map exchange improves the tracking of nodes joining and leaving an AMF network. This improves the efficiency of AMF networks. Node map exchange is only available if every node in your AMF network is running version 5.4.6-2.1 or later. We recommend running the latest version on all nodes in your network, so you receive the advantages of node map exchange and other improvements.

**Syntax** `show atmf nodes [guest|all]`

Parameter	Description
guest	Display only guest nodes in the AMF network.
all	Display all nodes in the AMF network, including guest nodes.

**Mode** Privileged Exec

**Usage notes** You can use this command to display one of three sets of nodes:

- all nodes except guest nodes, by specifying **show atmf nodes**
- all nodes including guest nodes, by specifying **show atmf nodes all**
- only guest nodes, by specifying **show atmf nodes guest**

**Examples** To display AMF information for all nodes except guest nodes, use the command:

```
node1# show atmf nodes
```

Table 62-1: Sample output from **show atmf nodes**

```
node1#show atmf nodes guest

Node Information:

* = Local device

SC = Switch Configuration:
C = Chassis S = Stackable N = Standalone

Node Device ATMF Parent Node
Name Type Master SC Domain Depth

* M1 x510-28GTX Y S none 0
N3 x230-18GP N N M1 1
N1 AR4050S N N M1 1

Node map exchange is active
Current ATMF node count 3
```

To display AMF information for all nodes, including guest nodes, use the command:

```
node1# show atmf nodes all
```

**Table 63:** Sample output from **show atmf nodes all**. In this example, not all nodes support node map exchange, as shown by the message at the end

```
node1#show atmf nodes all

Node and Guest Information:

* = Local device

SC = Switch Configuration:
C = Chassis S = Stackable N = Standalone G = Guest

Node/Guest Device ATMF Parent Node
Name Type Master SC Domain Depth

* M1 x510-28GTX Y S none 0
N3 x230-18GP N N M1 1
N1 AR4050S N N M1 1
N3-1.0.24 AT-TQ4600 N G N3 -

Node map exchange is inactive
Firmware on some nodes does not support node map exchange, eg AR4050S
Current ATMF node count 4 (guests 1)
```

To display AMF information for guest nodes only, use the command:

```
node1# show atmf nodes guest
```

**Table 62-1:** Sample output from **show atmf nodes guest**

```
node1#show atmf nodes guest

Guest Information:
Device MAC IP/IPv6
Name Address Parent Port Address

aastra-... 0008.5d10.7635 Node-1 1.0.2 192.168.4.7

# show atmf provision nodes

**Overview** This command displays information about each provisioned node with details about date and time of creation, boot and configuration files available in the backup, and license files present in the provisioned backup. This includes nodes that have joined the network but are yet to run their first backup.

This command can only be run on AMF master and controller nodes.

**Syntax** `show atmf provision nodes`

**Mode** Privileged Exec

**Usage notes** This command will only work if provisioned nodes have already been set up. Otherwise, an error message is shown when the command is run.

**Example** To show the details of all the provisioned nodes in the backup use the command:

```
NodeName# show atmf provision nodes
```

Figure 62-30: Sample output from the **show atmf provision nodes** command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media: SD (Total 3827.0MB, Free 3481.1MB)

# show atmf recovery-file

**Overview** Use this command to display the recovery file information for an AMF node. AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

**Syntax** `show atmf recovery-file`

**Mode** Privileged Exec

**Example** To display recovery file information for an AMF node, use the command:

```
node1# show atmf recovery-file
```

**Output** Figure 62-31: Example output from **show atmf recovery-file**

```
node1#show atmf recovery-file

# show atmf secure-mode

**Overview** Use this command to display an overview of the secure mode status of an AMF network.

**Syntax** show atmf secure-mode

**Mode** Privileged Exec

**Example** To display an overview of AMF secure mode on an AMF master or member node, use the command:

```
awplus# show atmf secure-mode
```

**Output** Figure 62-32: Example output from **show atmf secure-mode** on an AMF master

```
ATMF Secure Mode:

Secure Mode Status : Enabled
Certificate Expiry : 180 Days

```

Table 62-2: Parameters in the output from **show atmf secure-mode**

Parameter	Description
Secure Mode Status	Shows the status of secure mode, Enabled or Disabled.
Certificate Expiry	Certificate expiry time. Set with <a href="#">atmf secure-mode certificate expiry</a>
Certificates Total	Total number of certificates.
Certificates Revoked	Certificates that have been revoked by the AMF master.
Certificates Rejected	Certificates that have been rejected by the AMF master.
Certificates Active	Certificates that are currently active.
Provisional Authorization	Number of nodes with provisional authorization. For more information use the <a href="#">show atmf authorization provisional</a> command.
Pending Requests	Number of nodes waiting for authorization on the AMF master. For more information use the <a href="#">show atmf authorization pending</a> command.
Trusted Master	List of trusted masters in the AMF area.
Key Fingerprint	The AMF node's key fingerprint.

# show atmf secure-mode audit

**Overview** Use this command to detect security vulnerabilities on a node.

**Syntax** show atmf secure-mode audit

**Mode** Privileged Exec

**Example** To display AMF secure mode link audits for a node, use the command  
awplus# show atmf secure-mode audit

**Output** Figure 62-34: Example output from **show atmf secure-mode audit**

```
ATMF Secure Mode Audit:

Warning : The default username and password is enabled.
Good : SNMP V1 or V2 is disabled.
Warning : Telnet server is enabled.
Good : ATMF is enabled. Secure-Mode is on.
Good : ATMF Topology-GUI is disabled. No trustpoints configured.

ATMF Secure Mode Log Events:

2017 Feb 2 00:59:25 user.notice node1 ATMF[848]: Sec_Audit - ATMF Secure
Mode is enabled.
2017 Feb 2 01:30:00 user.notice node1 ATMF[848]: Sec_Audit - Established
secure connection to area_1_node_1 on interface vlink1.
```

Table 62-3: Parameters in the output from **show atmf secure-mode audit link**

Parameter	Description
ATMF Secure Mode Audit	A list of security recommendations to secure the AMF network. Items prefaced with <code>Warning</code> need to be fixed. In the sample above the default username and password, and telnet, should be disabled.
ATMF Secure Mode Log Events	A list of recorded secure mode log events.

**Related commands** [show atmf secure-mode](#)

**Command changes** Version 5.4.7-0.3: command added

# show atmf secure-mode audit link

**Overview** Use this command to detect security vulnerabilities by identifying devices that are connected to a secure mode node that are not in secure mode or are not authorized.

**Syntax** `show atmf secure-mode audit link`

**Mode** Privileged Exec

**Example** To display AMF secure mode link audits for a node, use the command

```
awplus# show atmf secure-mode audit link
```

**Output** Figure 62-35: Example output from **show atmf secure-mode audit link**

```
ATMF Secure Mode Audit Link:

* ATMF links connected to devices which are not authorized
 or are not in secure-mode.

Port Link Type Discovered Node/Area Name

```

Table 62-4: Parameters in the output from **show atmf secure-mode audit link**

Parameter	Description
Port	Port name on local device.
Link Type	Link type.
Discovered	Date discovered
Node/Area Name	Node or area name of remote device.

**Related commands** [show atmf](#)  
[show atmf secure-mode](#)

**Command changes** Version 5.4.7-0.3: command added

# show atmf secure-mode certificates

**Overview** Use this command to display the certificate status details when secure mode is enabled on an AMF network.

**Syntax** `show atmf secure-mode certificates [detail] [area <area-name>]  
[node <node-name>]`

Parameter	Description
detail	Display detailed certificate information.
area	Specify an AMF area.
<area-name>	The AMF area you want to see the certificate information for.
node	Specify an AMF node.
<node-name>	The AMF node you want to see information for.

**Mode** Privileged Exec

**Example** To display AMF secure mode certificates on a master or member node, use the command:

```
awplus# show atmf secure-mode certificates
```

To display detailed information about AMF secure mode certificates for a node named "area\_2\_node\_1" in an area named "area-2", use the command:

```
awplus# show atmf secure-mode certificates detail area area-2
node area_2_node_1
```

**Output** Figure 62-36: Example output from **show atmf secure-mode certificates**

```
Area-1 Certificates:
Node Name Signer Expires Status

area_1_node_1 master_1 11 Mar 2017
 master_2 4 Mar 2017 Active
area_1_node_2 master_1 11 Mar 2017
 master_2 4 Mar 2017 Revoked

Area-2 Certificates:
Node Name Signer Expires Status

area_2_node_1 master_1 18 Mar 2017 Active
area_2_node_2 master_1 18 Mar 2017 Rejected
```

Table 62-5: Parameters in the output from **show atmf secure-mode certificates**

Parameter	Description
Node Name	Name of AMF node the certificate was issued to.
Signer	Name of AMF master that issued the certificate.
Expires	Certificate expiry date.
Status	The status column will display <i>Active</i> before a member node is trusted, and can be accessed using AMF commands. Valid statuses are <i>Active</i> , <i>Revoked</i> , and <i>Rejected</i> .

**Output** Figure 62-37: Example output from **show atmf secure-mode certificates detail area area-2 node area\_2\_node\_1**

```
Certificates Detail:

area_2_node_1 (area:area-2)
 MAC Address : 0000.cd37.0003
 Status : Active

**Table 64:** Parameter definitions from the **show atmf tech** command

Parameter	Definition
ATMF Status	Shows status of AMF feature on the Node as Enabled/Disabled.
Network Name	The name of the AMF network to which this node belongs.
Node Name	The name assigned to the node within the AMF network.
Role	The role configured on the device within the AMF - either master or member.
Current ATMF Nodes	A count of the AMF nodes in the AMF network.
Node Address	The identity of a node (in the format name.atmf) that enables its access it from a remote location.
Node ID	A unique identifier assigned to an AMF node.
Node Depth	The number of nodes in the path from this node to the core domain.
Domain State	A node's state within an AMF Domain - either controller or backup.
Recovery State	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - either Auto, Manual, or None.
Management VLAN	The VLAN created for traffic between nodes of different domains (up/down links). VLAN ID - In this example VLAN 4092 is configured as the Management VLAN. Management Subnet - the Network prefix for the subnet. Management IP Address - the IP address allocated for this traffic. Management Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17)

**Table 64:** Parameter definitions from the **show atmf tech** command (cont.)

Parameter	Definition
Domain VLAN	The VLAN assigned for traffic between Nodes of same domain (crosslink). VLAN ID - In this example VLAN 4091 is configured as the domain VLAN. Domain Subnet - the Subnet address used for this traffic. Domain IP Address - the IP address allocated for this traffic. Domain Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17)
Device Type	Shows the Product Series Name.
ATMF Master	Indicates the node's membership of the core domain (membership is indicated by Y)
SC	Shows switch configuration: <ul style="list-style-type: none"><li>• C - Chassis (such as SBx8100 series)</li><li>• S - Stackable (VCS)</li><li>• N - Standalone</li></ul>
Parent	A node that is connected to the present node's uplink, i.e. one layer higher in the hierarchy.
Node Depth	Shows the number of nodes in path from the current node to the Core domain.

**NOTE:** The **show atmf tech** command can produce very large output. For this reason only the most significant terms are defined in this table.

# show atmf virtual-links

**Overview** This command displays a summary of all virtual links (L2TP tunnels) currently in the running configuration.

**Syntax** `show atmf virtual-links [macaddr]`  
`show atmf virtual-links [id <1-4094>] [remote-id <1-4094>]`  
`show atmf virtual-links detail [id <1-4094>]`

Parameter	Description
macaddr	Display the virtual AMF links' MAC addresses.
id <1-4094>	ID of the local virtual link.
remote-id <1-4094>	ID of the remote virtual link
detail	Display information about a specific virtual link ID or range of virtual link IDs. Displays information such as: local and remote IP address, link type, packets received and transmitted.

**Mode** Privileged Exec

**Example 1** To display AMF virtual links, use the command:

```
node_1# show atmf virtual-links
```

Table 62-1: Example output from **show atmf virtual-links**

```
ATMF Virtual-Link Information:

Local Local Remote Tunnel Tunnel
Port ID IP ID IP Protect State

vlink1 1 172.16.24.2 2 1.0.0.2 - Complete
vlink2 2 172.16.24.2* 10 172.16.24.3* ipsec Complete
vlink3 3 (eth0)* 1 1.2.3.4 - AcquireLocal

* = Dynamic Address.

Virtual Links Configured: 3
```

In the above example, a centrally located switch has the IP address space 192.0.2.x/24. It has two VLANs assigned the subnets 192.0.2.33 and 192.0.2.65 using the prefix /27. Each subnet connects to a virtual link. The first link has the IP address 192.168.1.1 and has a Local ID of 1. The second has the IP address 192.168.2.1 and has the Local ID of 2.

**Example 2** To display details about AMF virtual link with ID 1, use the command:

```
node_1# show atmf virtual-links detail id 1
```

Table 62-2: Example output from **show atmf virtual-links**

```

Virtual Link Detailed Information:

ID 1 Description : None
ID 1 Local IP Address : 192.168.5.1
ID 1 Remote ID : 1
ID 1 Remote IP Address : 192.168.5.20
ID 1 Link Type : virtual-link
ID 1 Packets Received : 236465
ID 1 Packets Transmitted : 192626

```

**Example 3** To display AMF virtual links’ MAC address information, use the command:

```
node_1# show atmf virtual-links macaddr
```

Table 62-3: Example output from **show atmf virtual-links macaddr**

```

ATMF Link Remote Information:

ATMF Management Bridge Information:

Bridge: br-atmfmgmt

port no mac addr is local? ageing timer
 1 00:00:cd:27:c2:07 yes 0.00
 2 8e:c7:ae:81:7e:68 yes 0.00
 2 00:00:cd:28:bf:e7 no 0.01

```

Table 62-4: Parameters in the output from **show atmf virtual-links**

Parameter	Definition
Local Port	The tunnel name e.g. vlink1, vlink2, equivalent to an L2TP tunnel.
Local ID	The local ID of the virtual link. This matches the vlink<number>
Tunnel Protect	Tunnel protection protocol.
Tunnel State	The operational state of the vlink (either Up or Down). This state is always displayed once a vlink has been created.
mac addr	AMF virtual links terminate on an internal soft bridge. The “show atmf virtual-links macaddress” command displays MAC Address information.
is local?	Indicates whether the MAC displayed is for a local or a remote device.
ageing timer	Indicates the current aging state for each MAC address.

**Related commands** [atmf virtual-link](#)

# show atmf working-set

**Overview** This command displays the nodes that form the current AMF working-set.

**Syntax** `show atmf working-set`

**Mode** Privileged Exec

**Example** To show current members of the working-set, use the command:

```
ATMF_NETWORK[6]# show atmf working-set
```

**Table 63:** Sample output from the **show atmf working-set** command.

```
ATMF Working Set Nodes:
node1, node2, node3, node4, node5, node6
Working set contains 6 nodes
```

# show debugging atmf

**Overview** Use this command to see what debugging is turned on for AMF.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging atmf`

**Mode** Privileged Exec

**Example** To display the AMF debugging status, use the command:

```
node_1# show debugging atmf
```

Table 62-1: Sample output from the **show debugging atmf** command.

```
node_1# show debugging atmf
ATMF debugging status:
ATMF arealink debugging is on
ATMF link debugging is on
ATMF crosslink debugging is on
ATMF database debugging is on
ATMF neighbor debugging is on
ATMF packet debugging is on
ATMF error debugging is on
```

**Related commands** [debug atmf packet](#)

# show debugging atmf packet

**Overview** Use this command to see what debugging is turned on for AMF Packet debug. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging atmf packet

**Mode** User Exec and Privileged Exec

**Example** To display the AMF packet debugging status, use the command:

```
node_1# show debug atmf packet
```

Table 62-2: Sample output from the **show debugging atmf packet** command.

```
ATMF packet debugging is on
=== ATMF Packet Debugging Parameters===
Node Name: x908
Port name: port1.1.1
Limit: 500 packets
Direction: TX
Info Level: Level 2
Packet Type Bitmap:
2. Crosslink Hello BPDU pkt with downlink domain info
3. Crosslink Hello BPDU pkt with uplink info
4. Down and up link Hello BPDU pkts
6. Stack hello unicast pkts
8. DBE request
9. DBE update
10. DBE bitmap update
```

**Related commands** [debug atmf](#)  
[debug atmf packet](#)

# show running-config atmf

**Overview** This command displays the running system information that is specific to AMF.

**Syntax** `show running-config atmf`

**Mode** User Exec and Global Configuration

**Example** To display the current configuration of AMF, use the following commands:

```
node_1# show running-config atmf
```

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Related commands** `show running-config`  
`no debug all`

# state

**Overview** This command sets the running state of an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `state {enable|disable}`

Parameter	Description
disable	Stop the AMF container. The container's state changes to stopped.
enable	Start the AMF container. The container's state changes to running.

**Default** By default, **state** is disabled.

**Mode** AMF Container Configuration

**Usage notes** The first time the **state enable** command is executed on a container it assigns the container to an area and configures it as an AMF master. This is achieved by automatically adding the following configuration to the AMF container:

```
atmf network-name <AMF network-name>
atmf master
atmf area <container area-name> <container area-id> local
atmf area <container area-name> password <container area-password>
atmf area <host area-name> <host area-id>

interface eth0
 atmf-arealink remote-area <host area-name> vlan 4094
```

For this reason the **state enable** command should be run after the container has been created with the [atmf container](#) command and an area-link configured with the [area-link](#) command.

Once the start-up configuration has been saved from within the AMF container, all further configuration changes need to be made manually.

**Example** To start the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state enable
```

To stop the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state disable
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# switchport atmf-agentlink

**Overview** Use this command to configure a link between this device and an x600 Series switch, in order to integrate the x600 Series switch into your AMF network. The x600 Series switch is called an “AMF agent”, and the link between the x600 and this device is called an “agent link”.

The x600 Series switch must be running version 5.4.2-3.16 or later.

Use the **no** variant of this command to remove the agent link. If the x600 Series switch is still connected to the switch port, it will no longer be part of the AMF network.

**Syntax** `switchport atmf-agentlink`  
`no switchport atmf-agentlink`

**Default** By default, no agent links exist and x600 Series switches are not visible to AMF networks.

**Mode** Interface mode for a switch port. Note that the link between the x600 and the AMF network must be a single link, not an aggregated link.

**Usage notes** The x600 Series switch provides the following information to the AMF node that it is connected to:

- The MAC address
- The IPv4 address
- The IPv6 address
- The name/type of the device (Allied Telesis x600)
- The name of the current firmware
- The version of the current firmware
- The configuration name

AMF guestnode also makes most of this information available from x600 Series switches, but requires configuration with DHCP and/or LLDP. AMF agent is simpler; as soon the x600 is connected to an appropriately configured port of an AMF node, it is immediately integrated into the AMF network.

To see information about the x600 Series switch, use the **show atmf links guest detail** command.

**Example** To configure port1.0.1 as an agent link, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport atmf-agentlink
```

**Related commands** [show atmf links guest](#)

# switchport atmf-arealink

**Overview** This command enables you to configure a port or aggregator to be an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network.

Use the **no** variant of this command to remove any AMF area link that may exist for the selected port or aggregated link.

This command is only available on AMF controllers and master nodes.

**Syntax** `switchport atmf-arealink remote-area <area-name> vlan <2-4094>`  
`no switchport atmf-arealink`

Parameter	Description
<area-name>	The name of the remote area that the port is connecting to.
<2-4094>	The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link.

**Default** No arealinks are configured.

**Mode** Interface Configuration for a switchport, a static aggregator, or a dynamic channel group.

**Usage notes** Run this command on the port or aggregator at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will automatically place the port or static aggregator into trunk mode (i.e. switchport mode trunk) and will synchronize the area information stored on the two nodes.

You can configure multiple arealinks between two area nodes, but only one arealink at any time will be in use. All other arealinks will block information, to prevent network storms.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

**NOTE:** See the [atmf-arealink](#) command to configure an AMF area link on an AR-series Eth interface.

**Example** To make switchport port1.0.2 an arealink to the 'Auckland' area on VLAN 6, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.2
controller-1(config-if)# switchport atmf-arealink remote-area
Auckland vlan 6
```

To remove switchport port1.0.1 as an AMF area link, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.1
controller-1(config-if)# no switchport atmf-arealink
```

**Related commands**

- [atmf area](#)
- [atmf area password](#)
- [atmf virtual-link](#)
- [show atmf links](#)

# switchport atmf-crosslink

**Overview** This command configures the selected port, statically aggregated link or dynamic channel group (LACP) to be an AMF crosslink. Running this command will automatically place the port or aggregator into trunk mode (i.e. **switchport mode trunk**).

The connection between two AMF masters must utilize a crosslink. Crosslinks are used to carry the AMF control information between master nodes. Multiple crosslinks can be configured between two master nodes, but only one crosslink can be active at any particular time. All other crosslinks between masters will be placed in the blocking state, in order to prevent broadcast storms.

Use the **no** variant of this command to remove any crosslink that may exist for the selected port or aggregated link.

**Syntax** `switchport atmf-crosslink`  
`no switchport atmf-crosslink`

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage notes** Crosslinks can be used anywhere within an AMF network. They have the effect of separating the AMF network into separate domains.

Where this command is used, it is also good practice to use the **switchport trunk native vlan** command with the parameter **none** selected. This is to prevent a network storm on a topology of ring connected devices.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

**Example 1** To make switchport port1.0.1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-crosslink
```

**Example 2** This example is shown twice. Example 2A is the most basic command sequence. Example 2B is a good practice equivalent that avoids problems such as broadcast storms that can otherwise occur.

**Example 2A** To make static aggregator sa1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
```

**Example 2B** To make static aggregator sa1 an AMF crosslink, use the following commands for good practice:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
Node_1(config-if)# switchport trunk allowed vlan add 2
Node_1(config-if)# switchport trunk native vlan none
```

In this example VLAN 2 is assigned to the static aggregator, and the native VLAN (VLAN 1) is explicitly excluded from the aggregated ports and the crosslink assigned to it.

**NOTE:** *The AMF management and domain VLANs are automatically added to the aggregator and the crosslink.*

**Related commands** [show atmf links statistics](#)

# switchport atmf-guestlink

**Overview** Guest links are used to provide basic AMF functionality to non AMF capable devices. Guest links can be configured for either a selected switch port or a range of switch ports and use generic protocols to collect status and configuration information that the guest devices make available.

Use the **no** variant of this command to remove the guest node functionality from the selected port or ports.

**NOTE:** AMF guest nodes are not supported on ports using the OpenFlow protocol.

**Syntax** `switchport atmf-guestlink [class <guest-class>] [ip <A.B.C.D> | ipv6 <X:X::X:X>]`  
`no switchport atmf-guestlink`

Parameter	Description
<code>class</code>	Set a guest class
<code>&lt;guest-class&gt;</code>	The name of the guest class.
<code>ip</code>	Specifies that the address following will have an IPv4 format
<code>&lt;A.B.C.D&gt;</code>	The guest node's IP address in IPv4 format.
<code>ipv6</code>	Specifies that the address following will have an IPv6 format
<code>&lt;X:X::X:X&gt;</code>	The guest node's IP address in IPv6 format.

**Default** No guest links are configured.

**Mode** Interface

**Example 1** To configure switchport port1.0.1 to be a guest link, that will connect to a guest node having a guest class of **camera** and an IPv4 address of **192.168.3.3**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class camera ip
192.168.3.3
```

**Example 2** To configure switchport port1.0.1 to be a guest link, which will connect to a guest node having a guest class of **phone** and an IPv6 address of **2001:db8:21e:10d::5**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class phone ipv6
2000:db8:21e:10d::5
```

**Example 3** To configure switchport port1.0.1 to be a guest link, using the default model type and learning method address, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink
```

**Example 4** To configure switchports port1.0.1 to port1.0.3 to be guest links, for the guest class **camera**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1-port1.0.3
node1(config-if)# switchport atmf-guestlink class camera
```

**Example 5** To remove the guest-link functionality from switchport port1.0.1, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# no switchport atmf-guestlink
```

**Related commands**

- show atmf guests

# switchport atmf-link

**Overview** This command enables you to configure a port or aggregator to be an up/down AMF link. Running this command will automatically place the port or aggregator into trunk mode. If the port was previously configured in access mode, the configured access VLAN will be removed.

Use the **no** variant of this command to remove any AMF link that may exist for the selected port or aggregated link.

**Syntax** `switchport atmf-link`  
`no switchport atmf-link`

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage notes** Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

Within each domain, cross-links between AMF nodes define those nodes as siblings within the same domain. You can form rings by combining cross-links with up/down links and/or virtual links, as long as each AMF domain links upwards to only a single parent domain. Each domain may link downwards to multiple child domains.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

**NOTE:** See the [atmf-link](#) command to configure an AMF up/down link on an AR-series Eth interface.

**Example** To configure switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-link
```

To remove switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# no switchport atmf-link
```

**Related commands** [atmf-link](#)  
[show atmf detail](#)  
[show atmf links](#)

# type atmf guest

**Overview** This command configures a trigger to activate when an AMF guest node joins or leaves.

**Syntax** `type atmf guest {join|leave}`

Parameter	Description
join	AMF guest node joins.
leave	AMF guest node leaves.

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when an AMF guest node leaves, use the following commands:

```
awplus(config)# trigger 86
awplus(config-trigger)# type atmf guest leave
```

**Related commands** [show trigger](#)

**Command changes** Version 5.5.1-1.1: command added

# type atmf node

**Overview** This command configures a trigger to activate when an AMF node joins or leaves.

**Syntax** type atmf node {join|leave}

Parameter	Description
join	AMF node joins.
leave	AMF node leaves.

**Mode** Trigger Configuration

**Example 1** To configure trigger 5 to activate when an AMF node leaves, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger)# type atmf node leave
```

**Example 2** The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

### Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=====
node1:
=====

TR# Type & Details Description Ac Te Tr Repeat #Scr Days/Date

001 Periodic (2 min) Periodic Status Chk Y N Y Continuous 1 smtwtfS

=====
Node2, Node3,
=====

TR# Type & Details Description Ac Te Tr Repeat #Scr Days/Date

005 ATMF node (leave) E-mail on ATMF Exit Y N Y Continuous 1 smtwtfS

```

### Display the triggers configured on each of the nodes in the AMF Network.

```
AMF-Net[3]# show running-config trigger
```

This command returns the following display:

```
=====
Node1:
=====

trigger 1
 type periodic 2
 script 1 atmf.scp
trigger 5
 type atmf node leave
description "E-mail on ATMF Exit"
 script 1 email_me.scp
!

=====
Node2, Node3:
=====

trigger 5
 type atmf node leave
description "E-mail on ATMF Exit"
 script 1 email_me.scp
!
```

**Related commands** [show trigger](#)

# undebbug atmf

**Overview** This command is an alias for the **no** variant of the [debug atmf](#) command.

# username

**Overview** This command enables you to assign a **username** to a guest class. Guests may require a username and possibly also a password. In its non-encrypted form the password must be between 1 and 32 characters and will allow spaces. In its encrypted form the password must be between 1 to 64 characters and will allow any character

**Syntax** `username <name> password [8] <userpass>`  
`no username`

Parameter	Description
username	Indicates that a user name is to follow.
<name>	User name of the guest node.
password	Indicates that a password (or specifier) is to follow.
8	Specifier indicating that the following password is encrypted. It's primary purpose is to differentiate between the configuration input and the CLI input. You should not specify this for CLI input.
<userpass>	The password to be entered for the guest node.

**Default** No usernames configured

**Mode** AMF Guest Configuration

**Example** To assign the user name 'reception' and the password of 'secret' to an AMF guest node that has the guest class of 'phone1' use the following commands:

```
node1# configure terminal
node1(config)# amf guest-class phone1
node1(config-atmf-guest)# username reception password secret
```

To remove a guest node username and password for the user guest class 'phone1', use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class phone1
node1(config-atmf-guest)# no username
```

# 63

# Autonomous Wave Control Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure *Autonomous Wave Control (AWC)*.

AWC is an advanced network technology that utilizes game theory to deliver significant improvements in wireless network connectivity and performance. AWC can automatically minimize coverage gaps and reduce Access Point (AP) interference and respond to network configuration changes and bandwidth demands from user devices.

You can configure AWC through the command line, or through the Device GUI.

For more information, see the [Vista Manager mini User Guide](#).

- Command List**
- ["3gpp-info \(wireless-network-passpoint-dot11u\)"](#) on page 3347

# 3gpp-info (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the 3GPP (802.11u 3rd Generation Partnership Project) cellular network information.

Use the **no** variant of this command to revert to the default value.

**Syntax** `3gpp-info <code-list>`  
`no 3gpp-info`

Parameter	Description
<code>&lt;code-list&gt;</code>	<p>Enter the MCC (Mobile Country Code) and MNC (Mobile Network Code):</p> <ul style="list-style-type: none"><li>• MCC must be a 3 digit decimal number</li><li>• MNC must be a 2 or 3 digit decimal number</li><li>• MCC and MNC must be separated by commas</li><li>• If setting multiple combinations of MCC and MNC, they must be separated by semicolons.</li><li>• A maximum of 100 characters can be set including commas and semicolons.</li></ul> <p>For more information on mobile country and network codes, go to: <a href="#">Wikipedia Mobile Country Codes</a>.</p>

**Default** Not set.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To set some of the MCC and MNC codes for Japan, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# 3gpp-info
440,00;440,50
```

**Related commands** [show wireless network](#)  
[dot11u \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# additional-step-required enable (wireless-network-passpoint-dot11u)

**Overview** Use this command to configure an Additional Step Required for Access.  
Use the **no** variant of this command to disable Additional Step Required for Access.

**Syntax** `additional-step-required enable`  
`no additional-step-required enable`

**Default** Disabled.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Usage notes** Typically, access and authentication is automatic if a legacy hotspot is operated by the mobile device's Home Service Provider (SP) or if the user has previously authenticated to that hotspot. Additionally, user intervention is typically required in a roaming environment where the hotspot is not operated by the Home SP and additional steps are required to identify and authenticate with the Home SP.

**Example** To enable Additional Step Required for Access, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
additional-step-required enable
```

**Related commands** [show wireless network](#)  
[dot11u \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# airtime-fairness enable (wireless-ap-prof-radio)

**Overview** Use this command to enable **airtime-fairness** for all wireless clients regardless of speed.

Use the **no** variant of this command to disable airtime-fairness for all wireless clients.

**Syntax** `airtime-fairness enable`  
`no airtime-fairness enable`

**Default** Disabled.

**Mode** Wireless AP Profile Radio Configuration

**Usage notes** Airtime-fairness ensures that every client has equal access to air time, regardless of client capability. Client capability includes the wireless standard 802.11 mode and Radio Frequency (RF) link signal strength.

If two clients were each assigned a 10 Mbps bandwidth and sending equally sized frames then they potentially could have unequal air time if their RF link characteristics were different.

RF link characteristics are based upon the distance of the client from the Access Point (AP). A client that is closer to the AP typically operates at a higher data rate than a client farther from the AP. This is because the AP and client are deliberately designed to adapt their transmission rates in order to maintain an optimal quality of the RF link.

This behavior is normal between the AP and clients since the client devices are not expected to remain at a constant or equal distance from the AP. This could mean that one device is consuming more airtime than it is entitled to, even though that device is not consuming more than its bandwidth limit.

Note: This command is valid on TQ series devices only.

**Example** To enable airtime-fairness for 'radio 2' on 'ap-profile100' use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-prof 100
awplus(config-wireless-ap-prof)# ap-prof 100
awplus(config-wireless-ap-prof-radio)# radio 2
awplus(config-wireless-ap-prof-radio)# airtime-fairness enable
```

**Related commands** [radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# anqp-domain-id (wireless-network-passpoint-hs20)

**Overview** Use this command to set the ANQP (Access Network Query Protocol) domain identifier.

Use the **no** variant of this command to reset the ANQP domain identifier to the default value.

**Syntax** `anqp-domain-id <0-65535>`  
`no anqp-domain-id`

Parameter	Description
<code>&lt;0-65535&gt;</code>	ANQP domain identifier.

**Default** 0

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To set the ANQP domain identifier on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# anqp-domain-id
1
```

**Related commands** [show wireless network](#)  
[hs20 \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# anqp-element (wireless-network-passpoint-dot11u)

**Overview** Use this command to configure the Arbitrary Access Network Query Protocol (ANQP) element.

ANQP is a query and response protocol that defines services offered by an access point (AP), typically at a Wi-Fi hot spot.

Use the **no** variant of this command to remove a specified ANQP element entry.

**Syntax** `anqp-element info-id <0-999> payload HEX`  
`no anqp-element info-id <0-999>`

Parameter	Description
<0-999>	Arbitrary ANQP element configuration's unique entry number.
HEX	Arbitrary ANQP element configuration. The maximum number of characters in HEX is 100.

**Default** Not set.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To configure the ANQP element info ID to '1' and the payload HEX value to '0000', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# anqp-element
info-id 1 payload 0000
```

**Related commands** [show wireless network](#)  
[dot11u \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# antenna (wireless-ap-prof-radio)

**Overview** Use the antenna command to set the antenna model for a wireless Access Point (AP).

Use the **no** variant of this command to remove the designated antenna model for a wireless AP.

**Syntax** antenna {an2458-10dp|an5158-16dp|an5158-19dp}  
no antenna

Parameter	Description
an2458-10dp	Antenna model AN2458-10DP
an5158-16dp	Antenna model AN5158-16DP
an5158-19dp	Antenna model AN5158-19DP

**Default** Not set.

**Mode** Wireless AP Profile Radio Configuration

**Example** To configure an AP radio configuration to use the antenna model AN5158-19DP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap)# hwtype tq single spec 11n
awplus(config-wireless-ap)# band 5
awplus(config-wireless-ap)# radio 1
awplus(config-wireless-ap-radio)# antenna an5158-19dp
```

**Related commands** [hwtype](#)  
[band](#)

**Command changes** Version 5.4.7-2.4: command added

# ap

**Overview** Use this command to configure an Access Point (AP).  
If the AP doesn't already exist, then this command creates it.  
Use the **no** variant of this command to remove an AP configuration.

**Syntax** `ap <1-65535>`

Parameter	Description
<code>&lt;1-65535&gt;</code>	AP configuration ID number.

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** This command adds an AP configuration and enters the AP configuration mode.

**Example** To configure an AP with an ID of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 10
```

**Related commands**

- [radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# ap-profile (wireless)

**Overview** Use this command to configure an AP (Access Point) profile. If the AP profile doesn't already exist, then this command creates it.

Use the **no** variant of this command to delete an AP profile.

**Syntax** `ap-profile <1-65535>`  
`no ap-profile <1-65535>`

Parameter	Description
<code>&lt;1-65535&gt;</code>	The AP profile ID number.

**Default** Not set.

**Mode** Wireless Configuration

**Example** To configure an AP profile with the ID profile number of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
```

To remove the AP profile 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no ap-profile 10
```

**Related commands** [show wireless ap-profile](#)

[show wireless ap-profile](#)

**Command changes** Version 5.4.7-2.4: command added

# ap-profile (wireless-ap)

**Overview** Use this command to set an Access Point (AP) Profile to an AP.  
Use the **no** variant of this command to delete an AP Profile.

**Syntax** `ap-profile <1-65535>`  
`no ap-profile`

Parameter	Description
<code>&lt;1-65535&gt;</code>	AP Profile configuration ID number.

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To set AP Profile (ap-profile 100) to the AP 1 configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 1
awplus(config-wireless-ap)# ap-profile 100
```

**Related commands** [ap](#)  
[ap-profile \(wireless\)](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# association-advertisement enable

**Overview** Use this command to enable an Association Advertisement on the network configuration.

Use the **no** variant of this command to disable the Association Advertisement on the network configuration.

**Syntax** `association-advertisement enable`  
`no association-advertisement enable`

**Default** Disabled.

**Mode** Wireless Network Configuration

**Example** To enable the Association Advertisement for network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# association-advertisement
enable
```

**Related commands** [show wireless network](#)  
[network \(wireless\)](#)

**Command changes** Version 5.5.1-0.1: command added

# authentication (wireless-sec-wep)

**Overview** Use this command to enable or disable authentication on a wireless Access Point (AP).

**Syntax** authentication {both|open-system|shared-key}

Parameter	Description
both	Use both types of authentication: open-system and shared-key authentication.
open-system	No authentication.
shared-key	WEP authentication.

**Default** Open-system.

**Mode** Wireless Security WEP Configuration

**Usage notes** For **MWS** series devices, select either the open-system or shared-key parameter. You can't select the **both** parameter.

**Example** To configure WEP as the security authentication mode for clients, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wep
awplus(config-wireless-sec-wep)# authentication shared-key
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# auto-discovery disable

**Overview** Use this command to disable the automatic search for new APs in an AWC Smart Connect (AWC-SC) network.

Use the **no** variant of this command to enable the automatic search for new APs.

**Syntax** auto-discovery disable  
no auto-discovery disable

**Default** Enabled

**Mode** Wireless Smart Connect Profile Configuration

**Usage notes** Auto-discovery is a function that allows an AP that is in the factory default state to automatically become part of an AWC-SC network. This is because when a wireless AP is activated in the factory default state, its IP and MAC address are added to the AP profile and the Smart Connect profile.

**Example** To turn auto-discovery off for Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# auto-discovery disable
```

**Related commands** [smart-connect-profile](#)

**Command changes** Version 5.5.0-0.1: command added

# band

**Overview** Use this command to assign a frequency band to a single antenna wireless AP. Use the **no** variant of this command to set the band to the default value of 2.

**Syntax** band {2|5}  
no band

Parameter	Description
2	2.4GHz band
5	5GHz band

**Default** The default band is 2 (2.4GHz).

**Mode** Wireless AP Profile Configuration

**Usage notes** The command can only be used with single antenna APs.

**Example** To configure a 5GHz band for a single antenna AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# band 5
```

**Related commands** [ap-profile \(wireless\)](#)  
[show wireless ap-profile](#)  
[antenna \(wireless-ap-prof-radio\)](#)

**Command changes** Version 5.4.7-2.4: command added

# band-steering (wireless-network)

**Overview** Use this command to enable band steering on a wireless Access Point (AP).  
Use the **no** variant of this command to disable band steering.

**Syntax** `band-steering`  
`no band-steering`

**Default** Disabled.

**Mode** Wireless Network Configuration

**Usage notes** Band Steering detects dual-band capable clients and steers them to the 5 GHz frequency. This leaves the more crowded 2.4 GHz band available for legacy clients.  
This helps improve end user experience by reducing channel utilization, especially in high density environments  
This command is not supported on the **MWS** series products.

**Example** To enable band steering, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# band-steering
```

**Related commands** [network \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# bandwidth (wireless-ap-prof-radio)

**Overview** Use this command to assign a bandwidth to an Access Point (AP).  
Use the **no** variant of this command to revert to the default bandwidth.

**Syntax** `bandwidth {20|40|80}`  
`no bandwidth`

Parameter	Description
20	20MHz bandwidth
40	40MHz bandwidth
80	80MHz bandwidth

**Default** The default bandwidth value varies according to the configured hardware and radio type.

**Mode** Wireless AP Profile Radio Configuration

**Example** To assign a 40MHz bandwidth to AP-profile 100 for Radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# bandwidth 40
```

**Command changes** Version 5.4.7-2.4: command added.

# bcast-key-refresh-interval (wireless-sec-osen)

**Overview** Use this command to set the refresh interval for the broadcast (group) key used with an OSEN security configuration.

Use the **no** variant of this command to revert to the refresh interval default value.

**Syntax** `bcast-key-refresh-interval <0-86400>`  
`no bcast-key-refresh-interval`

Parameter	Description
<code>&lt;0-86400&gt;</code>	The key refresh interval in seconds. The range is 0 to 86400 seconds.

**Default** Zero (0) is the default.

**Mode** Wireless Security OSEN Configuration

**Usage notes** OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint). OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

**Example** To set a broadcast key refresh interval of 3600 for a security configuration, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# bcast-key-refresh-interval
3600
```

**Related commands** [security \(wireless\)](#)  
[show wireless security](#)

**Command changes** Version 5.5.0-2.3: command added

# bcast-key-refresh-interval (wireless-sec-wpa-ent)

**Overview** Use this command to set the refresh interval for the broadcast key used in a WPA-enterprise security configuration.

Use the **no** variant of this command to set the refresh interval for the broadcast key to the default.

**Syntax** `bcast-key-refresh-interval <0-86400>`  
`no bcast-key-refresh-interval`

Parameter	Description
<code>&lt;0-86400&gt;</code>	The refresh interval in seconds For the <b>MWS series</b> , the broadcast key refresh rate is <code>&lt;0, 30-3600&gt;</code> seconds.

**Default** The default refresh interval is 0 seconds.

**Mode** Wireless Security WPA-enterprise Configuration

**Example** To set 3600 seconds as the broadcast key refresh interval, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)#
bcast-key-refresh-interval 3600
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

# bcast-key-refresh-interval (wireless-sec-wpa-psnl)

**Overview** Use this command to set the refresh interval for a broadcast (group) key used in a WPA-personal security configuration.

Use the **no** variant of this command to set the refresh interval to the default value.

**Syntax** `bcast-key-refresh-interval <0-86400>`  
`no bcast-key-refresh-interval`

Parameter	Description
<code>&lt;0-86400&gt;</code>	The broadcast key refresh interval. For the <b>MWS series</b> , the broadcast key refresh rate is <code>&lt;0, 30-3600&gt;</code> seconds.

**Default** The default value is 0.

**Mode** Wireless Security WPA-personal Configuration

**Example** To set the broadcast key refresh interval to 3600 seconds on a WPA-personal security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)#
bcast-key-refresh-interval 3600
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# captive-portal

**Overview** Use this command to add a Captive Portal (web authentication) configuration and enter the Captive Portal configuration mode.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

This setting is only valid for AT-TQ series wireless access points.

Use the **no** variant of this command to remove a Captive Portal configuration.

**Syntax** `captive-portal`  
`no captive-portal`

**Default** Captive Portal is not set.

**Mode** Wireless Network Configuration

**Example** To enter the Captive Portal configuration mode of network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
```

To reset all the Captive Portal configuration settings of network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no captive-portal
```

**Command changes** Version 5.4.9-1.1: command added

# bss-trans-manage enable

**Overview** Use this command to enable Basic Service Set (BSS) Transition Management on a wireless network configuration. The BSS consists of one redistribution point — typically an access point (WAP or AP) interconnecting all associated wireless clients.

Use the **no** variant of this command to disable BSS Transition Management on a wireless network configuration.

**Syntax** `bss-trans-manage enable`  
`no bss-trans-manage enable`

**Default** Disabled.

**Mode** Wireless Network Configuration

**Example** To configure enable BSS Transition Management, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# bss-trans-manage enable
```

**Command changes** Version 5.5.0-2.3: command added

# captive-portal virtual-ip

**Overview** Use this command to configure the virtual IP address on Captive Portal.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

Use the **no** variant of this command to remove the virtual IP address on Captive Portal.

**Syntax** captive-portal virtual-ip <ip-address>  
no captive-portal virtual-ip

Parameter	Description
<ip-address>	The IPv4 address uses the format A.B.C.D

**Default** Not set.

**Mode** Wireless AP Profile Configuration

**Usage notes** Captive Portal uses the AP's management IP address to show an authentication page. To avoid a potential security risk, this command allows you to hide the AP management IP address by providing a virtual IP address for Captive Portal authentication.

**Example** To configure a virtual IP address for Captive Portal, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 5
awplus(config-wireless-ap-prof)# captive-portal virtual-ip
1.1.1.1
```

**Command changes** Version 5.5.0-1.3: command added

# cb-channel

**Overview** Use this command to designate the fixed channel for channel blanket used by each of the radios in an AP profile.

Use the **no** variant of this command to revert to the default channel setting.

**Syntax** `cb-channel radio <1-3> channel <channel-number>`  
`no cb-channel radio <1-3>`

Parameter	Description
<1-3>	Select the radio interface number to be a fixed channel.
<channel-number>	Fixed channel number. Select the channel from the eligible channels listed in the AP profile.

**Default** Not set. When the parameter is blank, an eligible channel is configured automatically.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Example** To configure cb-channel 10 to radio1 and cb-channel 40 to radio2 on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof)# cb-channel radio 1 channel 10
awplus(config-wireless-ap-prof)# cb-channel radio 2 channel 40
```

**Related commands** [show wireless ap-profile](#)

**Command changes** Version 5.4.9-1.1: command added

# cb-proxy-arp enable

**Overview** Use this command to enable Proxy ARP on an AP profile channel blanket configuration.  
Use the **no** variant of this command to disable Proxy ARP on an AP profile channel blanket configuration.

**Syntax** `cb-proxy-arp enable`  
`no cb-proxy-arp enable`

**Default** Disabled.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Example** To enable Proxy ARP for AP profile 1 channel blanket, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# cb-proxy-arp enable
```

**Related commands** [show wireless ap-profile](#)  
[channel-blanket](#)

**Command changes** Version 5.5.1-0.1: command added

# channels (wireless-ap-prof-radio)

**Overview** Use this command to set the channel that a wireless Access Point (AP) uses when it is set to auto.

Use the **no** variant of this command to return the AP channel to its default.

**Syntax** channels <1-255>  
no channels

Parameter	Description
<1-255>	The channel number.

**Default** The default channel varies with each type of AP, its country-code, and outdoor settings.

**Mode** Wireless AP Profile Radio Configuration

**Example** To set the wireless AP radio channel, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# channels 10
```

**Related commands** [radio \(wireless-ap-profile\)](#)  
[hwtype](#)

**Command changes** Version 5.4.7-2.4: command added.

# channel-blanket

**Overview** Use this command to enter the wireless-AP-profile-channel-blanket configuration mode. Once in this mode, you can modify the channel blanket configuration parameters for a wireless AP profile. A wireless AP profile defines the radio settings, such as band and channel selection and the control VLAN. The AP profile names the SSIDs to which it applies.

**NOTE:** *The channel-blanket setting can only be used with AT-TQ5403 and AT-TQ5403e APs. If this is set for other APs, you will not be able to manage those APs.*

Use the **no** variant of this command to reset all parameters for channel blanket to default.

**Syntax** channel-blanket  
no channel-blanket

**Default** Not set

**Mode** Wireless AP Profile Configuration

**Usage notes** When the command is entered, if the "key" parameter is empty, the automatically generated value is set.

**Example** To enter the channel blanket configuration mode for AP profile 2, enter the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap profile 2
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)#
```

To reset all the channel blanket parameters of AP profile 2, enter the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap profile 2
awplus(config-wireless-ap-prof)# no channel-blanket
```

**Related commands** [show wireless ap-profile](#)  
[vap](#)

**Command changes** Version 5.4.9-1.1: command added

# channel (wireless-ap-radio)

**Overview** Use this command to configure a channel on an Access Point (AP). You can configure an AP to automatically select a channel or use a fixed channel.

Use the **no** variant of this command to remove any configured channels and return to the default value.

**Syntax** `channel {auto|<1-255>}`  
`no channel`

Parameter	Description
auto	The channel is automatically selected.
<1-255>	A list of fixed channels. The list is determined by the country-code.

**Default** The default is **auto**.

**Mode** Wireless AP Radio Configuration

**Example** To configure a fixed channel for an AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# channel 1
```

**Command changes** Version 5.4.7-2.4: command added.

# ciphers (wireless-sec-osen)

**Overview** Use this command to set which cipher suite to use with OSEN wireless security configuration.

Use the **no** variant of this command to revert to the default cipher suite.

**Syntax** `ciphers <cipher-list>`  
`no ciphers`

Parameter	Description
<code>&lt;cipher-list&gt;</code>	<p>Designate the cipher suite(s) in a list format. The cipher options are either <b>ccmp</b> or <b>tkip</b> or both in any order. The combinations you can select depend on the WPA version as follows:</p> <ul style="list-style-type: none"><li>• If the version is a combination of <b>wpa</b> and <b>wpa2</b>, the cipher suite can be either <b>ccmp</b> only or a combination of <b>ccmp</b> and <b>tkip</b>.</li><li>• If the version is only <b>wpa2</b>, the cipher suite can be selected from <b>ccmp</b> only or a combination of <b>ccmp</b> and <b>tkip</b>.</li><li>• If the version is only <b>wpa3</b>, only <b>ccmp</b> can be selected as the cipher suite.</li></ul>

**Default** **ccmp**

**Mode** Wireless Security OSEN Configuration

**Usage notes** OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint). OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

**Example** To configure both ccmp (AES) and tkip as the cipher suite on a security configuration of OSEN, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# ciphers ccmp tkip
```

# ciphers (wireless-sec-wpa-ent)

**Overview** Use this command to set the cipher suite(s) used by WPA-personal security configurations. The cipher suites available are: CCMP (AES) and TKIP.

Use the **no** variant of this command to set the default cipher suite used by WPA-personal security configurations.

**Syntax** `ciphers <cipher-list>`  
`no ciphers`

Parameter	Description
<code>&lt;cipher-list&gt;</code>	The available cipher suite(s) in list format. The list can contain either <b>ccmp</b> or <b>tkip</b> or both and can be in any order.

**Default** CCMP.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** For **MWS** series devices, a combination of versions and ciphers are supported as follows:

- versions wpa2 and ciphers ccmp
- versions wpa, wpa2, and ciphers tkip and ccmp

**Example** To set both CCMP (AES) and TKIP as cipher suites on a security WPA-enterprise configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# ciphers ccma tkip
```

# community read-only (wireless-ap-prof-snmp)

**Overview** Use this command to set an SNMP read-only community name for the target AP profile. This command is valid for SNMP v1 and v2c only.

Use the **no** variant of this command to set the SNMP read-only community name back to the default (public).

**Syntax** `community read-only <community-name>`  
`no community read-only`

Parameter	Description
<code>&lt;community-name&gt;</code>	The community name to set. Valid characters are: - alphanumeric characters - symbols except for the following 6 symbols: " '\ & < >

**Default** public

**Mode** Wireless AP Profile SNMP Configuration

**Example** To set the SNMP read-only community name to 'private', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# community read-only
private
```

To set the SNMP trap community name back to the default (public), use the commands:

```
awplus# configure terminal

# conn-capability protocol (wireless-network-passpoint-hs20)

**Overview** Use this command to specify the protocols supported by the network connection and the corresponding port numbers and whether the port is open or closed.

Use the **no** variant of this command to remove the settings for the specified protocol number.

**Syntax** `conn-capability protocol <0-255> port <0-65535> status [closed|open|unknown]`  
`no conn-capability protocol <0-255>`

Parameter	Description
<0-255>	Protocol number, as in the assigned protocol numbers listed at: <a href="http://www.iana.org">www.iana.org</a> .
<0-65535>	Port number
closed	Indicates the connection is in closed mode
open	Indicates the connection is in open mode
unknown	Indicates the connection status is unknown

**Default** Not set.

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Usage notes** These settings signify the capabilities of the wired network that the AP is connected to. They provide information on the connection status of the most commonly used communication protocols and ports within the hotspot.

**Example** To set the connection capability on port 161 to 'closed' for protocol 17 (UDP), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)#
conn-capability protocol 17 port 161 status closed
```

**Related commands** [show wireless network](#)

# control-vlan

**Overview** Use this command to create a control VLAN ID for a wireless AP belonging to channel blanket.

Use the **no** variant of this command to clear an AP's designated channel blanket VLAN ID.

**Syntax** `control-vlan <vlan-id>`  
`no control-vlan`

Parameter	Description
<code>&lt;vlan-id&gt;</code>	The designated VLAN ID <1-4094> used on a wireless AP belonging to channel blanket.

**Default** Not set

**Mode** Wireless AP Profile Channel Blanket Configuration

**Example** To set the channel blanket control VLAN for AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# control-vlan 10

# country-code

**Overview** Use this command to set the country code for an AP-profile.

Use the **no** variant of this command to revert back to the default country code for the device's region.

**Syntax** `country code <code>`  
`no country code`

Parameter	Description
<code>&lt;code&gt;</code>	A two letter code representing the country. Use the command <code>show wireless country-code</code> to see the full list of country codes available.

**Default** The default country code is '**jp**' for Japan or '**us**' for other regions.

**Mode** Wireless AP Profile Configuration

**Usage notes** To display a list of the country codes that can be applied, use the command **show wireless country-code**

Note, applying a new country code will reset the following configuration for the **ap-profile** and **ap-radio** modes:

- mode, bandwidth, and channel

**Example** To set the country code to 'New Zealand' for AP-profile 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# country-code nz
```

**Related commands**

- `show wireless country-code`
- `show wireless ap-profile`
- `channel (wireless-ap-radio)`
- `mode (wireless-ap-prof-radio)`
- `bandwidth (wireless-ap-prof-radio)`

**Command changes** Version 5.4.7-2.4: command added

# day (wireless-task)

**Overview** Use this command to set a day or range of days to run a task.

You can use the **time** command along with the **day** command to more fully set the task run time configuration.

Use the **no** variant of this command to remove the day set to run a task.

**Syntax** `day {<day> <month> <year>|<daysofweek>|every-day}`  
`no day`

Parameter	Description
<day>	The day set for the task. Select a number from 1-31.
<month>	The month to run the task. Enter the first three letters of the month, for example Jan, Feb, Mar...
<year>	The year to run the task. Select a year between <2000-2035>.
<daysofweek>	The day or days of the week to run the task. (sunday monday tuesday wednesday thursday friday saturday)
every-day	Set the task to run on every day of the week.

**Default** Not set.

**Mode** Wireless Task Configuration

**Example** To configure task 5 to run on the 22nd of September 2017, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# day 22 Sep 2017
```

**Related commands** [task](#)  
[show wireless task](#)  
[time \(wireless-task\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# deauth-req-timeout (wireless-network-passpoint-hs20)

**Overview** Use this command to configure the deauthentication request timeout.  
Use the **no** variant of this command to revert the deauthentication timeout time to the default value.

**Syntax** `deauth-req-timeout <0-65535>`  
`no deauth-req-timeout`

Parameter	Description
<code>&lt;0-65535&gt;</code>	The timeout, in seconds, for client deauthentication after sending WNM notification frames. WNM notification requests allow the hotspot feature to send clients the URLs of servers that allow the client to access information about how to subscribe to the service, correct connection errors, or extend the current session.

**Default** 60 seconds.

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To configure a deauthentication request timeout of 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)#
deauth-req-timeout 120
```

**Related commands** [show wireless network](#)  
[hs20 \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# debug wireless

**Overview** Use this command to enable wireless debugging. Debugging filters can be based on severity level and module name.

Use the **no** variant of this command to disable all wireless debugging.

**Syntax**

```
debug wireless level
{all|debug|dump|error|info|notice|trace|warning}

debug wireless module
{all|apca|apmgr|apreq|clnmgr|cwmcore|rogue|syncscan}

no debug wireless
```

Parameter	Description
level	Filters logging events by severity level and displays the output by one of the following configured options:
all	All level events
debug	Debug events
dump	Dump events
error	Error conditions
info	Information messages
notice	Normal, but significant conditions
trace	Trace events
warning	Warning conditions
module	Filters logging events by module name and displays the output by one of the following configured options:
all	All module events
apca	Auto power/channel assignment events
apmgr	AP manager events
apreq	HTTP AP request events
clnmgr	Client manager events
cwmcore	CWM core events
rogue	Rogue events
syncscan	Sync scan events

**Default** Disabled

**Mode** User Exec

**Example** To enable debugging of wireless with 'info' level on the 'apca' module, use the command:

```
awplus# debug wireless level info module apca
```

To disable debugging of wireless, use the command:

```
awplus# no debug wireless
```

**Related commands** [show debugging wireless](#)

**Command changes** Version 5.5.0-0.1: command added

# description (wireless-ap)

**Overview** Use this command to specify a description to identify an Access Point (AP).  
Use the **no** variant of this command to remove the description of a selected AP.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	Text to describe a specific AP.

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To specify a description for an AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 10
awplus(config-wireless-ap)# description AP10_MEETING_SPACE
```

**Related commands** [ap](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

## description (wireless-ap-prof)

**Overview** Use this command to configure an AP-profile description. You must be in the **config-wireless-ap-prof** mode to use this command.

Use the **no** variant of this command to remove an AP-profile description.

**Syntax** `description <description>`  
`no description`

**Default** Not set.

**Mode** Wireless AP Profile Configuration

**Example** To configure the description "PROF10" for an AP-profile, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# description PROF10
```

**Related commands** [ap-profile \(wireless\)](#)  
[show wireless ap-profile](#)

**Command changes** Version 5.4.7-2.4: command added

# description (wireless-mac-flt)

**Overview** Use this command to set the description of a wireless MAC filter.  
Use the **no** variant of this command to remove the description.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	Text describing the wireless MAC filter.

**Default** No description set by default.

**Mode** Wireless MAC Filter Configuration

**Example** To set the description of MAC filter '20' to 'mywhitelist', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# description mywhitelist
```

To remove the description from MAC filter '20', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# no description
```

**Related commands**

- [filter-entry](#)
- [show wireless ap-profile](#)
- [show wireless wireless-mac-filter](#)
- [wireless export](#)
- [wireless import](#)
- [wireless-mac-filter \(wireless\)](#)
- [wireless-mac-filter \(wireless-ap-prof\)](#)
- [wireless-mac-filter enable](#)

**Command changes** Version 5.4.8-2.1: command added

# description (wireless-network)

**Overview** Use this command to set a description for the wireless network.  
Use the **no** variant of this command to remove a description for a wireless network.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	Set a description for a wireless network.

**Default** Not set.

**Mode** Wireless Network Configuration

**Example** To set the description for a wireless network, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# description GUEST_NETWORK
```

**Related commands** [network \(wireless\)](#)  
[show wireless network](#)

**Command changes** Version 5.4.7-2.4: command added.

# description (wireless-sc-prof)

**Overview** Use this command to configure a descriptive name for a Smart Connect profile. Use the **no** variant of this command to remove a Smart Connect profile name.

**Syntax** `description <sc-profile-name>`  
`no description`

Parameter	Description
<code>&lt;sc-profile-name&gt;</code>	The descriptive name given to a Smart Connect profile.

**Default** Not set

**Mode** Wireless Smart Connect Profile Configuration

**Example** To set the descriptive name of SC-PROF10 for Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# description SC-PROF10
```

**Related commands** [smart-connect-profile](#)  
[show wireless ap-profile](#)

**Command changes** Version 5.5.0-0.1: command added

# description (wireless-task)

**Overview** Use this command to set a description for a wireless task configuration. Use the **no** variant of this command to remove a description for a wireless task configuration.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	The description for a wireless task configuration.

**Default** Not set.

**Mode** Wireless Task Configuration

**Example** To set a description for the wireless task 5 configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# description PERIODIC_AWC_CALC
```

**Related commands** [task](#)  
[show wireless task](#)

**Command changes** Version 5.4.7-2.4: command added.

# description (wireless-trigger)

**Overview** Use this command to set a description for a wireless trigger.  
Use the **no** variant of this command to delete the description for a wireless trigger.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	Text to describe the wireless trigger.

**Default** Not set.

**Mode** Wireless Trigger Configuration

**Example** To set a description on a wireless trigger, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-trigger 1
awplus(config-wireless-trigger)# description TRIGGER DESC 1
```

**Related commands** [wireless wireless-trigger](#)  
[wireless-trigger](#)  
[show wireless network](#)

**Command changes** Version 5.5.1-0.1: command added

# designated-ap

**Overview** Use this command to designate an AP to determine the BSSID (or name) of a channel blanket profile.

BSSIDs are used to describe sections of a wireless local area network. It recognizes the AP because it has a unique physical MAC address, which creates the wireless network.

This command configures the BSSID of the designated AP to be used as the BSSID of the channel blanket.

Use the **no** variant of this command to remove a designated AP.

**Syntax** `designated-ap <1-65535>`  
`no designated-ap`

Parameter	Description
<code>&lt;1-65535&gt;</code>	The ID of the designated AP.

**Default** Not set.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Usage notes** If you do not designate an AP, the AP with the lowest ID is assigned automatically.

**Example** To designate AP 1001 on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# designated-ap 1001
```

**Related commands** [ap-profile \(wireless-ap\)](#)  
[channel-blanket](#)  
[radio \(wireless-ap\)](#)

**Command changes** Version 5.4.9-1.1: command added

# dgaf enable

## (wireless-network-passpoint-hs20)

**Overview** Use this command to enable Downstream Group-Addressed Forwarding (DGAF).  
Use the **no** variant of this command to disable DGAF.

**Syntax** dgaf enable  
no dgaf enable

**Default** Enabled.

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To disable Downstream Group-Addressed Forwarding on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# no dgaf enable
```

**Related commands** [show wireless network](#)  
[proxy-arp enable](#)  
[hs20 \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# domain-name (wireless-network-passpoint-dot11u)

**Overview** Use this command to configure one or more domain names for the entity operating the AP.

Use the **no** variant of this command to revert to the default value.

**Syntax** `domain-name <domain-name>`  
`no domain-name`

Parameter	Description
<code>&lt;domain-name&gt;</code>	The Domain Name(s) <ul style="list-style-type: none"><li>• Use the FQDN format, e.g. domain-name example.com</li><li>• Multiple domain name entries must be separated by a comma</li><li>• The length of a character in the OI-List must be less than 255 , and 10 elements or less.</li></ul>

**Default** Not set

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To set two domain names, mydomain.com and example.net, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# domain-name
mydomain.com,example.net
```

**Related commands** [show wireless network](#)  
[dot11u \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# dot11u (wireless-network-passpoint)

**Overview** Use this command to add a new 802.11u configuration and enter the configuration mode.

Use the **no** variant of this command to revert to the default values.

**Syntax** dot11u  
no dot11u

**Default** Not set.

**Mode** Wireless Network Passpoint Configuration

**Example** To enter the 802.11u configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
```

**Command changes** Version 5.5.0-2.3: command added

# dtim-period

**Overview** Use this command to set the Delivery Traffic Indication Map (DTIM) period on the network configuration. A DTIM period value is a number that determines how often a beacon frame includes a Delivery Traffic Indication Message, and this number is included in each beacon frame.

Use the **no** variant of this command to reset the DTIM period to the default (1).

**Syntax** dtim-period <1-5>  
no dtim-period

Parameter	Description
<1-5>	DTIM period in seconds. Increasing this number will increase the power saving effect, but it will slow down the response.

**Default** 1.

**Mode** Wireless Network Configuration

**Usage notes** The DTIM is how the AP warns its clients that it is about to transmit the multicast (and broadcast) frames it queued up since the previous DTIM.

This queueing and scheduled delivery is done to allow power-conscious devices to save power by turning off their receivers for brief stretches of time, only waking up their receivers when the AP indicates it has traffic for them.

**Example** To set a DTIM period of 2 seconds on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# dtim-period 2
```

**Related commands** [show wireless network](#)  
[network \(wireless\)](#)

**Command changes** Version 5.5.1-0.1: command added

# dynamic-vlan enable (wireless-sec-osen)

**Overview** Use this command to enable the dynamic-vlan function on wireless APs using the OSEN security mode.

Use the **no** variant of this command to disable the dynamic-vlan function.

**Syntax** `dynamic-vlan enable`  
`no dynamic-vlan enable`

**Default** Enabled.

**Mode** Wireless Security OSEN Configuration

**Usage notes** OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint) OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

This command is not supported by MWS series APs.

**Example** To disable the dynamic-vlan function for security 100, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 100 mode osen
awplus(config-wireless-sec-osen)# no dynamic-vlan enable
```

**Related commands** [show wireless security](#)  
[security \(wireless\)](#)

**Command changes** Version 5.5.0-2.3: command added

# enable (wireless-ap-prof-snmp)

**Overview** Use this command to enable an SNMP configuration for the target AP profile. Use the **no** variant of this command to disable the SNMP configuration for the target AP profile.

**Syntax** enable  
no enable

**Default** Disabled

**Mode** Wireless AP Profile SNMP Configuration

**Example** To enable SNMP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# enable
```

To disable SNMP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no enable
```

**Command changes** Version 5.5.0-2.1: command added

# emergency-mode

**Overview** Use this command to set emergency mode on a wireless network. Wireless networks in emergency mode are only active when AWC is also in emergency mode. You can use emergency mode to prevent people from being isolated from infrastructure in the event of a natural disaster such as an earthquake or typhoon.

Use the **no** variant of this command to remove the emergency mode from a wireless network.

**Syntax** emergency-mode  
no emergency-mode

**Default** Disabled.

**Mode** Wireless Network Configuration

**Example** To configure an emergency mode for network 5, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 5
awplus(config-wireless-network)# emergency-mode
```

**Related commands** [show wireless network](#)  
[wireless emergency-mode](#)

**Command changes** Version 5.5.0-0.3: command added

# emergency-service-reachable enable (wireless-network-passpoint-dot11u)

**Overview** Use this command to configure Emergency Services Reachable.  
Use the **no** variant of this command to disable Emergency Services Reachable.

**Syntax** `emergency-service-reachable enable`  
`no emergency-service-reachable enable`

**Default** Disabled.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To enable Emergency Services Reachable, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
emergency-service-reachable enable
```

**Related commands** [show wireless network](#)

# enable (wireless)

**Overview** Use this command to enable Access Point (AP) management by Autonomous Wave Control (AWC).

Use the **no** variant of this command to disable AP management by AWC.

**Syntax** enable  
no enable

**Default** Disabled.

**Mode** Wireless Configuration

**Usage notes** You must use the **enable** command before you configure a management address.

**Example** To configure AP management by AWC, using an interface with the IP address 192.168.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# enable
awplus(config-wireless)# management address 192.168.0.1
```

**Related commands** [management address](#)

# enable (wireless-ap-prof-radio)

**Overview** Use this command to enable a wireless Access Point (AP) profile radio configuration.

Use the **no** variant of this command to disable a wireless AP profile radio configuration.

**Syntax** enable  
no enable

**Default** Disabled.

**Mode** Wireless AP Profile Radio Configuration

**Example** To enable an AP radio profile configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# enable
```

**Related commands** [radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added

# enable (wireless-network-cp)

**Overview** Use this command to enable Captive Portal (web authentication) configuration on the target network.

Use the **no** variant of this command to disable Captive Portal configuration on the target network.

**Syntax** enable  
no enable

**Default** Disabled

**Mode** Wireless Network Configuration

**Example** To enable Captive Portal, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# enable
```

**Related commands** captive-portal

**Command changes** Version 5.4.9-1.1: command added

# enable (wireless-network-passpoint)

**Overview** Use this command to enable Passpoint.  
Use the **no** variant of this command to disable Passpoint.

**Syntax** enable  
no enable

**Default** Disabled

**Mode** Wireless Network Passpoint Configuration

**Example** To enable Passpoint for network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# enable
```

**Related commands** [passpoint](#)

**Command changes** Version 5.5.0-2.3: command added

# enable (wireless-sec-wep)

**Overview** Use this command to enable a wireless WEP security configuration.  
Use the **no** variant of this command to disable a wireless WEP security configuration.

**Syntax** enable  
no enable

**Default** Disabled.

**Mode** Wireless Security WEP Configuration

**Example** To enable a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# enable
```

# enable (wireless-wds)

**Overview** Use this command to enable a wireless WDS security configuration.  
Use the **no** variant of this command to disable a wireless WDS security configuration.

**Syntax** enable  
no enable

**Default** Not set.

**Mode** Wireless WDS Configuration

**Example** To enable a wireless WDS configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# enable
```

**Related commands** [wds](#)  
[show wireless wds](#)

**Command changes** Version 5.4.7-2.4 command added.

# external-page-url

**Overview** Use this command to configure the external URL authentication page for Captive Portal.

To use this command, you must first specify external-page-redirect using the **mode** command.

Use the **no** variant of this command to reset the external authentication page URL.

**Syntax** external-page-url <URL>  
no external-page-url

Parameter	Description
<URL>	URL of the external authentication page

**Default** Disabled

**Mode** Wireless Network Captive Portal Configuration

**Example** To enable and set URL string 'http://www.example.com' for a Captive Portal external web authentication server on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# external-page-url
http://www.example.com
```

# filter-entry

**Overview** Use this command to add a filter entry to a wireless MAC filter. You can optionally include a description for the filter.

Use the **no** variant of this command to remove an entry from the MAC filter list.

**Syntax** `filter-entry <mac-address> [description <description>]`  
`no filter-entry <mac-address>`

Parameter	Description
<code>&lt;mac-address&gt;</code>	MAC address of the filter entry in hexadecimal format HHHH.HHHH.HHHH. The maximum number of MAC addresses that can be entered per MAC filter is 2048.
<code>description</code>	Set an optional description for the filter entry.
<code>&lt;description&gt;</code>	Text describing the filter entry.

**Default** No filter entries exist

**Mode** Wireless MAC Filter Configuration

**Example** To add a filter entry to MAC filter '20', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# filter-entry
0000.cd28.0880.1234 description PC01
```

To remove a filter entry from MAC filter '20', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# no filter-entry
0000.cd28.0880.1234
```

**Command changes** Version 5.4.8-2.1: command added

# force-disable (wireless-ap-radio)

**Overview** Use this command to override and force the disabling of an Access Point (AP) radio status.

Use the **no** variant of this command to stop overrides of an AP radio status.

**Syntax** `force-disable`  
`no force-disable`

**Default** **no force-disable** (do not override the AP profile radio status).

**Mode** Wireless AP Radio Configuration

**Example** To force a disable of an AP radio status, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# force-disable
```

# gas-address-behavior (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the GAS (Generic Advertisement Services) Address 3 behavior for 802.11u.

Use the **no** variant of this command to revert to the default value.

**Syntax** `gas-address-behavior <0-2>`  
`no gas-address-behavior`

Parameter	Description
<0-2>	<p>GAS Address 3 behavior.</p> <ul style="list-style-type: none"><li>• 0: P2P specification (Address3 = AP BSSID) workaround enabled by default based on GAS request Address3.</li><li>• 1: IEEE 802.11 standard compliant regardless of GAS request Address3</li><li>• 2: Force non-compliant behavior (Address3 = AP BSSID for all cases)</li></ul>

**Default** 0.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To configure the GAS Address 3 behavior value to 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
gas-address-behavior 1
```

**Command changes** Version 5.5.0-2.3: command added

# gas-comeback-delay (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the generic advertisement service (GAS) comeback-delay for 802.11u.

Use the **no** variant of this command to revert to the default value.

**Syntax** `gas-comeback-delay <0-65535>`  
`no gas-comeback-delay <0-65535>`

Parameter	Description
<code>&lt;0-65535&gt;</code>	GAS comeback delay Time Unit (TU) 1 TU = 1024 microseconds (approx 1 millisecond)

**Default** 0.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To configure the GAS comeback-delay value to 100, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
gas-comeback-delay 100
```

# hessid

## (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the HESSID (Homogeneous Extended Service Set Identifier).

Use the **no** variant of this command to revert to the default value.

**Syntax** hessid MAC  
no hessid

Parameter	Description
MAC	Homogeneous ESS Identifier, in Hexidecimal notation and MAC address format: HHHH.HHHH.HHHH.HHHH

**Default** Not set.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Usage notes** In typical Wi-Fi deployments, if two APs have different SSIDs, they are considered to be in different wireless networks.

If two APs have the same SSID, they are considered to be part of the same wireless network. But because SSIDs are not globally administered, it is possible that two APs with the same SSID are, in fact, in different wireless networks.

The homogeneous extended service set identifier (HESSID) element allows mobile devices to detect this condition. When two APs have the same SSID but from different wireless networks, the two networks have different HESSIDs

**Example** To set the Homogeneous ESS Identifier '02AA.BBCC.1122', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# hssid
02AA.BBCC.1122
```

**Related commands** [show wireless network](#)  
[dot11u \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# hide-ssid (wireless-network)

**Overview** Use this command to hide the SSID for a selected wireless network.  
Use the **no** variant of this command to stop hiding the SSID for a selected wireless network.

**Syntax** `hide ssid`  
`no hide ssid`

**Default** The default is Disabled, which means the SSID **is** included in the Access Point (AP) beacon frames. For more information, see the **Usage** section below.

**Mode** Wireless Network Configuration

**Usage notes** The SSID differentiates one wireless network from another, so all APs and all devices attempting to connect to a specific wireless network must use the same SSID to enable effective roaming.

SSIDs are included in beacon frames.

A beacon frame is one of the management frames in the IEEE 802.11 standard. Every compliant AP periodically sends beacon frames to advertise the presence of an AP in an area, its capabilities, and some configuration and security information to the client devices.

**Example** To hide the SSID for network 20, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# hide-ssid
```

**Related commands** [ssid \(wireless-network\)](#)  
[network \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# hs20 (wireless-network-passpoint)

**Overview** Use this command to add a new Hotspot 2.0 configuration and enter the configuration mode.

Use the **no** variant of this command to revert to the default.

**Syntax** hs20  
no hs20

**Default** Not set.

**Mode** Wireless Network Passpoint Configuration

**Example** To enter Hotspot 2.0 configuration mode on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)#
```

**Command changes** Version 5.5.0-2.3: command added

# hwtype

**Overview** Use this command to configure the hardware type used for a wireless AP profile. Use the **no** variant of this command to revert the AP hardware type to the default.

**Syntax** `hwtype <modelname>`  
`hwtype tq {single|dual|triple} spec {11ac|11n}`  
`hwtype tq dual spec {11ac|11n}`  
`no hwtype`

Parameter	Description
<code>&lt;modelname&gt;</code>	Set the model name. See the table below for a list of model names and associated settings.
<code>tq</code>	The hardware type used for the AT-TQ series
<code>mws</code>	The hardware type used for the AT-MWS series
<code>single</code>	Single antenna model. Only available for the AT-TQ series.
<code>dual</code>	Dual antenna model.
<code>spec</code>	Enable selection of support mode of the hardware type
<code>11ac</code>	Support for 802.11ac mode.
<code>11n</code>	Support for 802.11n mode.

**Table 1:** AP `modelname` parameters with applicable values

modelname	series	bands supported	standard supported
<code>at-tq5403</code> <code>at-tqm5403</code> <code>at-tq5403e</code>	<code>tq</code>	<code>triple</code>	<code>11ac</code>
<code>at-tq4400</code> <code>at-tq4400e</code> <code>at-tq4600</code> <code>at-tq1402</code> <code>at-tqm1402</code>	<code>tq</code>	<code>dual</code>	<code>11ac</code>
<code>at-tq2450</code> <code>at-tq3400</code> <code>at-tq3600</code>	<code>tq</code>	<code>dual</code>	<code>11n</code>
<code>at-tq3200</code>	<code>tq</code>	<code>single</code>	<code>11n</code>
<code>at-mws1750ap</code> <code>at-mws2533ap</code>	<code>mws</code>	<code>dual</code>	<code>11ac</code>
<code>at-mws600ap</code>	<code>mws</code>	<code>dual</code>	<code>11n</code>

**Default** hwtype tq dual spec 11ac.

**Mode** Wireless AP Profile Configuration

**Usage notes** This command may reset the following configuration commands for:

- antenna (AP profile)
- mode
- bandwidth
- channel

**Example** To configure the AP hardware type as an AT-TQ5403 (TQ series, triple antenna, supported by 802.11ac), use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# hwtype tq triple 11ac
```

To use the *<modelname>* parameter to configure the AP hardware type as an AT-TQ5403 (TQ series, triple antenna, supported by 802.11ac), use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# hwtype at-tq5403
```

**Related commands** ap-profile (wireless)

show wireless ap-profile

channels (wireless-ap-prof-radio)

**Command changes** Version 5.4.7-2.4: command added

Version 5.4.9-1.1: *<modelname>* parameter added.

# index

**Overview** Use this command to designate the key index number for WEP security.  
Use the **no** variant of this command to use the default key index number for WEP security.

**Syntax** `index <1-4>`  
`no index`

Parameter	Description
<1-4>	The index number for the WEP security key.

**Default** The default key index number is set to **1**.

**Mode** Wireless Security WEP Configuration

**Example** To assign key index number 3 for a WEP security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# index 3
```

**Related commands** [security \(wireless\)](#)  
[key \(wireless-sec-wep\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# initialization-button enable

**Overview** Use this command to enable the initialization button on a wireless AP using the selected AP profile.

Use the **no** variant of this command to disable the initialization button on a wireless AP using the selected AP profile.

**Syntax** `initialization-button enable`  
`no initialization-button enable`

**Default** Enabled.

**Mode** Wireless AP Profile Configuration

**Usage notes** This command effects only APs which have an initialization button.

**Example** To enable the initialization button on APs which use **ap-profile 100**, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# initialization-button enable
```

**Related commands** [ap-profile \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# internet-access enable (wireless-network-passpoint-dot11u)

**Overview** Use this command to enable Internet access. This informs the mobile device whether Internet access is available at a hotspot – which might not be the case in walled-garden environments, where the Hotspot Operator (for example, an hotel) may limit Wi-Fi access to locally available content.

Use the **no** variant of this command to disable Internet access.

**Syntax** `internet-access enable`  
`no internet-access enable`

**Default** Disabled.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To configure Internet access, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
internet-access enable
```

**Related commands** [show wireless network](#)  
[dot11u \(wireless-network-passpoint\)](#)

# ip-addr-type-availability (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the IPv4 and IPv6 Address Type Availability for 802.11u.

This is information about the IP address version and type that the Hotspot Operator uses and that would be allocated and available to a mobile device after it authenticates to the network.

Use the **no** variant of this command to reset the IPv4 and IPv6 Address Type Availability to their default value.

**Syntax** ip-addr-type-availability  
{no-exist|public|port-restrict|private-nat1|private-nat2|port-private-nat1|port-private-nat2|unknown} ipv4  
{no-exist|exist|unknown}  
no ip-addr-type-availability

Parameter	Description
no-exist (ipv4)	Not exist IPv4.
public (ipv4)	Public IPv4.
port-restrict (ipv4)	IPv4 with port restrictions.
private-nat1 (ipv4)	Private IPv4 address with Network Address Translation (NAT) once.
private-nat2 (ipv4)	Private IPv4 address with Network Address Translation (NAT) twice.
port-private-nat1 (ipv4)	Private IPv4 with port restrictions and Network Address Translation (NAT) once.
port-private-nat2 (ipv4)	Private IPv4 with port restrictions and Network Address Translation (NAT) twice.
unknown (ipv4)	Availability unknown IPv4
no-exist (ipv6)	Not exist IPv6
exist (ipv6)	Exist IPv6
unknown (ipv6)	Availability unknown IPv6

**Default** IPv4: port-private-nat1.

IPv6: no-exist

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To configure the IPv4 Address Type Availability to public and the IPv6 to no-exist, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
ip-addr-type-availability public ipv6 no-exist
```

**Related commands** [show wireless network](#)

# ip-address (wireless-ap)

**Overview** Use this command to specify the IP address of a wireless Access Point (AP).  
Use the **no** variant of this command to remove the IP address of the selected wireless AP.

**Syntax** `ip-address <ip-address>`  
`no ip-address`

Parameter	Description
<code>&lt;ip-address&gt;</code>	IPv4 address of the wireless AP.

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To specify an IPv4 address for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# ip address 192.168.0.100
```

**Related commands** [ap](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# key

**Overview** Use this command to designate the shared secret key used on a wireless AP belonging to channel blanket.

Use the **no** variant of this command to remove a designated key for a wireless AP belonging to channel blanket.

**Syntax** `key [encrypted] <key-string>`  
`no key`

Parameter	Description
<code>encrypted</code>	This parameter is displayed in show running-config output to indicate that it is displaying the password in encrypted form. You should not enter encrypted on the CLI yourself.
<code>&lt;key-string&gt;</code>	The usable key-string characters. They can be up to 16 letters using ASCII Printable excluding double-quote and single-quote.

**Default** Not set.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Usage notes** When not set, a random shared key is automatically generated.

**Example** To configure AP profile 100, with a channel blanket key, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# key L51nJ6Cp/A-bwXx3
```

# key (wireless-sc-prof)

**Overview** Use this command to set the Smart Connect profile security key.  
Use the **no** variant of this command to remove the security key from the Smart Connect profile.

**Syntax** `key <key-word>`  
`no key`

Parameter	Description
<code>&lt;key-word&gt;</code>	The WPA shared key. This is an alphanumeric string 8-64 characters long.

**Default** Not set

**Mode** Wireless Smart Connect Profile Configuration

**Usage notes** This command configures the WPA shared key for the Smart Connect network. If no key is set, the security key will be automatically generated.

**Example** To set the security key for Smart Connect profile 10 to 'sc10-secret-keyword', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# key sc10-secret-keyword
```

**Related commands** [smart-connect-profile](#)

**Command changes** Version 5.5.0-0.1: command added

# key (wireless-sec-wep)

**Overview** Use this command to set the key-string for a WEP security configuration. Use the **no** variant of this command to remove a key-string for a WEP security configuration.

**Syntax** `key <1-4> [encrypted] <key-string>`  
`no key <1-4>`

Parameter	Description
<1-4>	The key's index number. To configure the index number(s), use the <b>index</b> command.
encrypted	This parameter is displayed in <b>show running-config</b> output to indicate that it is displaying the password in encrypted form. You should not enter <b>encrypted</b> on the CLI yourself.
<key-string>	The usable key-string characters, which depend on the key-string type. Use the <b>type</b> command to configure the key-string character type. See the table in the usage section below for more information.

**Default** Not set.

**Mode** Wireless Security WEP Configuration

**Usage notes** When using the **key** command, also use the **type** command to set the key-string type to either ASCII or Hex, this will also set the character and bit number limits as follows.

Type	Number of bits	Number of characters	Case sensitive
ascii	64	5	Yes
ascii	128	13	Yes
hex	64	10	No
hex	128	26	No

**Example** To assign the word 'friend' as the key-string at index 3 for a WEP security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wep
awplus(config-wireless-sec-wep)# type ascii
awplus(config-wireless-sec-wep)# key 3 friend
```

# key (wireless-sec-wpa-psnl)

**Overview** Use this command to set a string as the shared secret key on a wireless security WPA-personal configuration.

Use the **no** variant of this command to reset the shared key to the default.

**Syntax** `key [encrypted] <key-string>`  
`no key`

Parameter	Description
<code>encrypted</code>	This parameter is displayed in <b>show running-config</b> output to indicate that it is displaying the password in encrypted form. You should not enter <b>encrypted</b> on the CLI yourself.
<code>&lt;key-string&gt;</code>	The usable key-string characters for the configuration. You can enter 8 to 63 ASCII characters which are case-sensitive.

**Default** Not set.

**Mode** Wireless Security WPA-personal Configuration

**Example** To set **friend** as the shared secret key for a WPA-personal configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# key friend
```

# l2tif enable (wireless-network-passpoint-hs20)

**Overview** Use this command to enable Layer 2 Traffic Inspection and Filtering (l2tif).  
Use the **no** variant of this command to disable Layer 2 Traffic Inspection and Filtering.

**Syntax** l2tif enable  
no l2tif enable

**Default** Disabled.

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To enable Layer 2 Traffic Inspection and Filtering on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20

# legacy-rates

**Overview** Use this command to set the legacy rates on the AP profile radio configuration. Use the **no** variant of this command to delete any configured fixed legacy rates and return to the default.

**Syntax** legacy-rates {all|<rates>}  
no legacy-rates

Parameter	Description
all	All available rate candidates are set for the specified radio.
<rates>	Multiple usable rate candidates can be set on the specified radio, separated by commas. <b>For 2.4 GHz radios:</b> <ul style="list-style-type: none"><li>Select from: 54, 48, 36, 24, 18, 12, 11, 9, 6, 5.5, 2, 1.</li><li>If the bandwidth is 20MHz, one of 1, 2, 5.5, 11 must be specified.</li><li>If the bandwidth is 40MHz, then 1 must be specified</li></ul> <b>For 5 GHz radios:</b> <ul style="list-style-type: none"><li>Select from: 54, 48, 36, 24, 18, 12, 9, 6.</li></ul> Regardless of bandwidth, one of 6, 12, 24 must be specified.

**Default** All.

**Mode** Wireless AP Profile Radio Configuration

**Example** To set specific legacy rates to an AP profile radio configuration, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# legacy-rates

# length (wireless-sec-wep)

**Overview** Use this command to set the key length for a WEP key on a wireless security WEP configuration.

Use the **no** variant of this command to reset the key length for a WEP key to the default value.

**Syntax** length {64|128}  
no length

Parameter	Description
64	Set 64 bit as the key length for a WEP key
128	Set 128 bit as the key length for a WEP key

**Default** 128 bit.

**Mode** Wireless Security WEP Configuration

**Example** To configure 64 bit length as the key length for a WEP key on a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# length 64
```

**Related commands** [security \(wireless\)](#)  
[key \(wireless-sec-wep\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# log enable destination

**Overview** Use this command to enable the external media function storing of wireless client and neighbor AP log files.

Use the **no** variant of this command to disable the external media function storing of wireless client and neighbor AP log files.

**Syntax** `log enable destination {usb|card}`  
`no log enable`

Parameter	Description
usb	USB storage device
card	SD card storage device

**Default** Disabled, there is no destination storage device set as a default.

**Mode** Wireless Configuration

**Example** To enable the log function and configure the log store destination to USB, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log enable destination usb
```

**Related commands** [log size wireless-client](#)  
[log rotate wireless-client](#)  
[log interval neighbor-ap](#)  
[show wireless](#)

**Command changes** Version 5.4.9-2.3: command added

# log interval neighbor-ap

**Overview** Use this command to configure the interval times for storing a neighbor AP log. Use the **no** variant of this command to revert to the default interval time of 30 minutes.

**Syntax** `log interval neighbor-ap <30-1440>`  
`no log interval`

Parameter	Description
<code>&lt;30-1440&gt;</code>	The interval time between storing neighbor AP logs. Enter a number in the range of 30 (min) -1440 (1 day).

**Default** 30 minutes

**Mode** Wireless Configuration

**Example** To configure a 60 minute interval time for storing neighbor AP logs, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log interval neighbor-ap 60
```

**Related commands** [log enable destination](#)  
[log rotate neighbor-ap](#)  
[show wireless](#)

**Command changes** Version 5.4.9-2.3: command added

# log rotate neighbor-ap

**Overview** Use this command to configure the number of rotations for storing neighbor AP log files. When the configured value is reached, the oldest log file is deleted and the latest log file is stored.

Use the **no** variant of this command to revert to the default value of 1.

**Syntax** `log rotate neighbor-ap <0-65534>`  
`no log rotate neighbor-ap`

Parameter	Description
<0-65534>	The number of rotations a neighbor AP log is stored for, before deleting the oldest stored file.

**Default** 1

**Mode** Wireless Configuration

**Example** To configure 100 generations of a neighbor's AP log files to be stored, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log rotate neighbor-ap 100
```

**Related commands** [log enable destination](#)  
[log interval neighbor-ap](#)  
[show wireless](#)

**Command changes** Version 5.4.9-2.3: command added

# log rotate wireless-client

**Overview** Use this command to configure the number of rotations for storing wireless client log files.

You can determine the size of each wireless client log by using this command and the **log size wireless-client** command together.

For example, log size wireless-client 50, log rotate wireless-client 4 ->  $50 / (4+1) = 10$ Kbytes.

Use the **no** variant of this command to revert to the default value of 1.

**Syntax** `log rotate wireless-client <0-255>`  
`no log rotate wireless-client`

Parameter	Description
<0-255>	The number of rotations for a wireless-client log. Set a number in the range 0-255.

**Default** The default number of rotations is 1.

**Mode** Wireless Configuration

**Example** To configure 10 generations of a wireless-client log file, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log rotate wireless-client 10
```

**Related commands** [log enable destination](#)  
[log size wireless-client](#)  
[show wireless](#)

**Command changes** Version 5.4.9-2.3: command added

# log size wireless-client

**Overview** Use this command to configure the file size used for storing wireless client logs. You can determine the size of each wireless client log by using this command and the **log rotate wireless-client** commands together. For example, log size wireless-client 50, log rotate wireless-client 4 ->  $50 / (4+1) = 10$ Kbytes. Use the **no** variant of this command to revert to the default log size value.

**Syntax** log size wireless-client <50-4194304>  
no log size wireless-client

Parameter	Description
<50-4194304>	Wireless client log size in kilobytes

**Default** 50 kilobytes.

**Mode** Wireless Configuration

**Example** To configure a wireless-client log size of 1Mbyte, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log size wireless-client 1000000
```

**Related commands** [log enable destination](#)

# login username (wireless-ap)

**Overview** Use this command to specify a username and password for a wireless Access Point (AP).

Use the **no** variant of this command to remove a username and password for a wireless AP.

**Syntax** login username *<username>* password *<password>*  
no login username

Parameter	Description
<i>&lt;username&gt;</i>	The username for the selected AP. The first character of the AP username must be a letter.
<i>&lt;password&gt;</i>	An alphanumeric string of characters used as the password for the selected AP.

**Default** Not set

**Mode** Wireless AP Configuration

**Example** To set the username **manager** and password **friend** for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# login username manager password friend
```

**Related commands** [ap](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# login-password (wireless-ap)

**Overview** Use this command to set the login password for an Access Point (AP).  
Use the **no** variant of this command to remove the login password for an AP.

**Syntax** login-password <password>  
no login-password

Parameter	Description
<password>	An alphanumeric string of characters used as the password for the selected AP.

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To configure a password for AP 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# login-password friend
```

**Related commands** [ap](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# mac-address (wireless-ap)

**Overview** Use this command to specify the MAC address for a wireless Access Point (AP).  
Use the **no** variant of this command to remove the MAC address of the selected wireless AP.

**Syntax** `mac-address <mac-address>`  
`no mac-address`

Parameter	Description
<code>&lt;mac-address&gt;</code>	The MAC address of the wireless AP in hexadecimal notation with the format HHHH.HHHH.HHHH.

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To specify a MAC address for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# mac-address 0000.5e00.5301
```

**Related commands** [ap](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# mac-auth password

**Overview** Use this command to change the password for MAC-based authentication. Use the **no** variant of this command to return the password to its default.

**Syntax** `mac-auth password <password>`  
`no mac-auth password`

Parameter	Description
<code>&lt;password&gt;</code>	The new password. Passwords can be up to 64 characters in length and can contain any printable characters except ?, " (double quotes), and spaces.

**Default** By default the password is the MAC address of the supplicant.

**Mode** Wireless Network Configuration

**Example** To set the password for MAC authentication to be 'SECRET', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# mac-auth password SECRET
```

To reset the password for MAC authentication to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no mac-auth password
```

**Related commands** [enable \(wireless-network-cp\)](#)

[mac-auth radius auth group \(wireless-network\)](#)  
[mac-auth username](#)

**Command changes** Version 5.4.9-2.1: command added

# mac-auth radius auth group (wireless-network)

**Overview** Use this command to enable MAC authentication of clients with a RADIUS group in a wireless network.

Use the **no** variant of this command to disable MAC authentication with a RADIUS group.

**Syntax** `mac-auth radius auth group {radius|<group-name>}`  
`no mac-auth radius auth group`

Parameter	Description
radius	Use a RADIUS group, which means <b>all</b> RADIUS servers.
<group-name>	The RADIUS server group.

**Default** Not set.

**Mode** Wireless Network.

**Usage notes** This command enables MAC authentication and designates a RADIUS server group to authenticate clients on a wireless network. RADIUS server groups are defined using the **aaa group server** command. RADIUS server groups can consist of multiple server hosts, but this command only uses two servers.

**Example** To enable MAC authentication with a RADIUS server group, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# mac-auth radius auth group
radius
```

**Related commands** [network \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# mac-auth username

**Overview** Use this command to set the format of the MAC address in the username and password field when a request for MAC-based authorization is sent to a RADIUS server.

Use the **no** variant of this command to reset the format to the default of hyphen and lower-case.

**Syntax** `mac-auth username {hyphen|colon|unformatted}  
{lower-case|upper-case}`  
`no mac-auth username`

Parameter	Description
hyphen	The MAC address includes hyphens, e.g. xx-xx-xx-xx-xx-xx.
colon	The MAC address includes colons, e.g. xx:xx:xx:xx:xx:xx.
unformatted	The MAC address does not include hyphens or colons, e.g. xxxxxxxxxxxx.
lower-case	The MAC address uses lower-case characters (a-f).
upper-case	The MAC address uses upper-case characters (A-F).

**Default** Default format is hyphen lower-case.

**Mode** Wireless Network Configuration

**Example** To configure the format of the MAC address in the username and password field to be colon and upper-case, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# mac-auth username colon
upper-case
```

To reset the format of the MAC address in the username and password field to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no mac-auth username
```

**Related commands** [enable \(wireless-network-cp\)](#)  
[mac-auth password](#)  
[mac-auth radius auth group \(wireless-network\)](#)

network (wireless)

**Command changes** Version 5.4.9-2.1: command added

# management address

**Overview** Use this command to configure a management address on the router for transmitting Autonomous Wave Control (AWC) packets to Access Points (APs). The management address must already exist on a device interface.

Use the **no** variant of this command to turn off AP management by AWC on the management address.

**Syntax** `managment address <ipv4-addr>`  
`no management address`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	Set the IPv4 interface address used for AP management by AWC.
<code>no</code>	Unset the IPv4 management address used for AP management by AWC.

**Default** Not enabled.

**Mode** Wireless Configuration

**Example** To configure an AP management interface address, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# management address 192.168.0.1
```

To remove an AP management interface address, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no management address
```

**Related commands** [enable \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# management-frame-protection enable (wireless-sec-osen)

**Overview** Use this command to enable management frame protection (MFP) for wireless Access Points (APs) using the OSEN security mode.

MFP provides security for management messages passed between APs and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

Use the **no** variant of this command to disable MFP.

**Syntax** `management-frame-protection enable [type {capable|required}]`  
`no management-frame-protection enable`

Parameter	Description
<code>type</code>	The type of protection, select <b>capable</b> or <b>required</b> . If protection <b>type</b> is omitted, then <b>capable</b> is the default protection type.
<code>capable</code>	Mixed operation. Allows legacy devices that do not support 802.11w to associate while also allowing devices that support 802.11w to use the 802.11w features.
<code>required</code>	Prevents clients that do not support 802.11w from associating with the SSID.

**Default** Enabled.

**Mode** Wireless Security OSEN Configuration

**Usage notes** Select the protection **type** based on the WPA version:

If the WPA version is:

- a combination of **wpa** and **wpa2**, then protection is disabled
- only **wpa2**, then the protection type can be either **capable**, **required**, or **disabled**
- only **wpa3**, then the protection type is **required**

**Example** To enable management frame protection for clients that do not support 802.11w, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode osen
awplus(config-wireless-sec-osen)# management-frame-protection
enable type required
```

To disable management frame protection, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode osen
awplus(config-wireless-sec-osen)# no
management-frame-protection enable
```

**Command  
changes**

Version 5.5.0-2.3: command added

# management-frame-protection enable (wireless-sec-wpa-ent)

**Overview** Use this command to enable management frame protection (MFP) in a WPA-enterprise configuration.

MFP provides security for management messages passed between wireless Access Points (APs) and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

Use the **no** variant of this command to disable MFP.

**Syntax** `management-frame-protection enable [type{capable|required}]`  
`no management-frame-protection enable`

Parameter	Description
<code>type</code>	The type of protection, select <b>capable</b> or <b>required</b> . If protection <b>type</b> is omitted, then <b>capable</b> is the default protection type.
<code>capable</code>	Mixed operation. Allows legacy devices that do not support 802.11w to associate while also allowing devices that support 802.11w to use the 802.11w features.
<code>required</code>	Prevents clients that do not support 802.11w from associating with the SSID.

**Default** Enabled.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** Select the protection **type** based on the WPA version:

If the WPA version is:

- a combination of **wpa** and **wpa2**, then protection is disabled
- only **wpa2**, then the protection type can be either **capable**, **required**, or **disabled**
- only **wpa3**, then the protection type is **required**

**Example** To **disable** MFP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-enterprise
awplus(config-wireless-sec-wpa-psnl)# no
management-frame-protection enable
```

**Related commands** [security \(wireless\)](#)  
[versions \(wireless-sec-wpa-ent\)](#)  
[show wireless security](#)

**Command changes** Version 5.4.7-2.4: command added.  
Version 5.5.0-2.3: parameter **type** added

# management-frame-protection enable (wireless-sec-wpa-psnl)

**Overview** Use this command to enable Management Frame Protection (MFP). MFP provides security for management messages passed between wireless Access Points (APs) and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

This parameter will be ignored when the version list includes **wpa3** as WPA3 requires that MFP is enabled, see [versions \(wireless-sec-wpa-psnl\)](#).

Use the **no** variant of this command to disable MFP.

**Syntax** `management-frame-protection enable [type {capable | required}]`  
`no management-frame-protection enable`

Parameter	Description
<code>type</code>	The type of protection, select <b>capable</b> or <b>required</b> . If protection <b>type</b> is omitted, then <b>capable</b> is the default protection type.
<code>capable</code>	Mixed operation. Allows legacy devices that do not support 802.11w to associate while also allowing devices that support 802.11w to use the 802.11w features.
<code>required</code>	Prevents clients that do not support 802.11w from associating with the SSID.

**Default** Enabled.

**Mode** Wireless Security WPA-personal Configuration

**Usage notes** Select the protection **type** based on the WPA version:

If the WPA version is:

- a combination of **wpa** and **wpa2**, then protection is disabled
- only **wpa2**, then the protection type can be either **capable**, **required**, or **disabled**
- only **wpa3**, then the protection type is **required**

**Example** To disable MFP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 100 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# no
management-frame-protection enable
```

# max-clients

**Overview** Use this command to set the number of clients able to connect to a wireless Access Point (AP).

Use the **no** variant of this command to return the number of clients able to connect to the default value.

**Syntax** `max-clients <0-200>`  
`no max-clients`

Parameter	Description
<code>&lt;0-200&gt;</code>	The number of clients able to connect to the wireless AP. Configuring the <b>number 0</b> will disable all clients from connecting to the selected AP. For the <b>MWS</b> series, the range is: <code>&lt;0-127&gt;</code> with a default of 127.

**Default** 200.

**Mode** Wireless AP Profile Radio Configuration

**Example** To set the maximum number of clients that can connect to a wireless AP to 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# max-clients 100
```

**Related commands** [radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# mode (wireless-ap-prof-radio)

**Overview** Use this command to set the **wireless standard** and **bandwidth** mode used by the Access Points (APs) in a secure wireless security configuration. The AP type or model determines which mode to select.

Use the **no** variant of this command to set the mode to the default values specified for an AP type.

**Syntax** mode {a|bg|a-n|bg-n|n-only-a|n-only-g|a-n-ac|n-ac}  
no mode

Parameter	Standard	Description
a	802.11a	Bandwidth 54Mbps - 5GHz
bg	802.11bg	Bandwidths 11 and 54Mbps- 2.4GHz.
a-n	802.11a/n	Bandwidths 54 and 300 Mbps - 2.4GHz.
bg-n	802.11b/g/n	Bandwidths 11, 54, and 300 Mbps - 2.4GHz
n-only-a	802.11n	Bandwidth 300 Mbps using the 5GHz bandwidth
n-only-g	802.11n	Bandwidth 300 Mbps using the 2.4GHz bandwidth
a-n-ac	802.11a/n/ac	Dual-band: supporting simultaneous connections on both the 2.4 GHz and 5 GHz Wi-Fi bands. 802.11ac offers backward compatibility to 802.11 b/g/n and bandwidth rated up to 1300 Mbps on the 5 GHz band plus up to 450 Mbps on 2.4 GHz.
n-ac	802.11n/ac	Dual-band: Bandwidth 54, and 300Mbps using both the 2.4 and 5GHz frequencies.

**Default** The default values change with each antenna type and AP.

**Mode** Wireless AP Profile Radio Configuration

**Example** To configure the wireless mode **a-n-ac** for AP profile 100, radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# mode a-n-ac
```

**Related commands** [country-code](#)  
[hwtype](#)  
[radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# mode (wireless-network-cp)

**Overview** Use this command to set the Captive Portal (web authentication) mode. Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access. Use the **no** variant of this command to reset the Captive Portal mode to default.

**Syntax** mode {click-through|radius|external-page-redirect}  
no mode

Parameter	Description
radius	The user name and password entered from the browser screen are sent to the RADIUS server and a network connection is permitted after successful authentication.
click-through	This method asks users to agree to the terms of use (click-through agreement) before allowing them to connect to the wireless network.
external-page-redirect	Redirect the authentication page to a user configured URL such as a third party Captive Portal vendor page.

**Default** click-through

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** Click-through is only valid for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 wireless access points.

Click-through is not supported on TQ2450, TQ3200, TQ3400 or TQ3600 APs. Set the mode to **radius** (external RADIUS authentication) for these devices.

**Example** To set the Captive Portal authentication mode as RADIUS, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# mode radius
```

# nai-realm

## (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the NAI (Network Access Identifier) Realm information. Use the **no** variant of this command to remove a specified NAI Realm entry.

**Syntax** `nai-realm <realm-number> realm-name <realm-name> eap-method <eap-method>`  
`no nai-realm <realm-number>`

Parameter	Description
<code>&lt;realm-number&gt;</code>	NAI Realm information's unique entry number in the range <1-10>
<code>&lt;realm-name&gt;</code>	NAI Realm name: <ul style="list-style-type: none"><li>• The NAI Realm Name in FQDN (Fully Qualified Domain Name) format.</li><li>• Multiple NAI Realm Names must be separated by a comma.</li><li>• The maximum number of characters allowed including commas is 100.</li></ul>
<code>&lt;eap-method&gt;</code>	Designated EAP method(s) in a list format. The list can use either <b>eap-tls</b> or <b>eap-ttls</b> or <b>eap-sim</b> or two of these three in any order.

**Default** Not set.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Usage notes** A network access identifier (NAI) is a standardized (RFC 4282) format for identifying users requesting access to a network (e.g.user@realm.com). Thus, an NAI Realm identifies the proper authentication server or domain for the user's authentication exchange.

**Example** To configure an NAI Realm Name and EAP method(s), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# nai-realm 2
realm-name example.com eap-method eap-tls eap-ttls
```

# neighbor-ap-detection enable

**Overview** Use this command to enable Neighbor AP Detection on the AP profile radio configuration.

Use the **no** variant of this command to disable Neighbor AP Detection for an AP profile radio configuration.

**Syntax** neighbor-ap-detection enable  
no neighbor-ap-detection enable

**Default** Enable.

**Mode** Wireless AP Profile Radio Configuration

**Example** To disable Neighbor AP Detection for APs using AP profile 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# no
neighbor-ap-detection enable

# network-auth-type (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the network authentication type.

Use the **no** variant of this command to remove the specified network authentication type.

**Syntax** `network-auth-type`  
{online-enrollment|terms-and-conditions|redirect-http-https|  
redirect-dns} [redirect-url <url>]

`no network-auth-type`  
{online-enrollment|terms-and-conditions|redirect-http-https|  
redirect-dns}

Parameter	Description
online-enrollment	Authentication type as online enrollment.
terms-and-conditions	Authentication type as terms and conditions.
redirect-http-https	Redirect using HTTP/HTTPS.
redirect-dns	Redirect using DNS.
redirect url <url>	Redirect using URL. The URL is an ASCII string of up to 128 characters other than the following characters: {, },  , \, ^, [, ], `. Refer to RFC-2396

**Default** Not set.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To set the network authentication type as online-enrollment with a redirect URL, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
network-auth-type online-enrollment redirect-url example.com
```

To delete the network authentication type online-enrollment, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# no
network-auth-type online-enrollment
```

# network-type (wireless-network-passpoint-dot11u)

**Overview** Use this command to select the access network type.

Use the **no** variant of this command to revert to the default access network type.

**Syntax** `network-type {private|guest-private|chargeable-public|free-public|personal-device|emergency|test|wildcard}`  
`no network-type`

Parameter	Description
private	Private network
guest-private	Private network with guest access
chargeable-public	Chargeable public network
free-public	Free public network
personal-device	Personal device network
emergency	Emergency service only network
test	Test or experimental network
wildcard	Wildcard

**Default** Private.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To enter the 802.11u configuration mode and set the network access type to free-public, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# network-type
free-public
```

**Related commands** [show wireless network](#)

**Command changes** Version 5.5.0-2.3: command added

# network (wireless)

**Overview** Use this command to configure an Autonomous Wave Control (AWC) network. If the network doesn't exist, then this command creates it. Use the **no** variant of this command to remove an AWC network.

**Syntax** `network <1-65535>`

Parameter	Description
<1-65535>	The network ID number

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** This command adds a network configuration and enters the network configuration mode.

**Example** To configure an AWC network with an ID of 20, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
```

**Related commands**

# ntp designated-server

**Overview** Use this command to designate the NTP server that a wireless Access point (AP) refers to.

Use the **no** variant of this command to remove the configured IP address or host-name of the NTP server.

**Syntax** `ntp designated-server {ip <ip-address>|host <host-name>}`  
`no ntp designated-server`

Parameter	Description
<code>&lt;ip-address&gt;</code>	Specify the IP address of the NTP server, entered in the form A.B.C.D for an IPv4 address.
<code>&lt;host-name&gt;</code>	Specify the host-name for the NTP server

**Default** Disabled.

**Mode** Wireless AP Profile Configuration

**Usage notes** This command sets the NTP server that a wireless AP refers to. If the NTP server is disabled, then the AP will synchronize its time with the AWC router.

This is because the AP can not hold current time after a reboot because it does not have a real-time clock.

Therefore, the NTP master must be configured on the AWC router.

**Example** To configure an NTP server with an IP address of 192.168.0.254 for ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# ntp designated-server
192.168.0.154
```

**Related commands** [ap-profile \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

# ntp designated-server enable

**Overview** Use this command to configure NTP on a wireless Access Point (AP).  
Use the **no** variant of this command to disable the NTP feature on an AP.

**Syntax** ntp designated-server enable  
no ntp designated-server enable

**Default** Enabled.

**Mode** Wireless AP Profile Configuration

**Example** To disable NTP for AP-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# no ntp designated-server
enable
```

**Related commands** [ntp designated-server](#)

**Command changes** Version 5.4.7-2.4: command added.

# ntp designated-server period

**Overview** Use this command to set the time adjustment period for an NTP server. This is the time adjustment period for a wireless AP using the selected AP profile.

Use the **no** variant of this command to reset the time adjustment period to the default of 10 minutes.

**Syntax** `ntp designated-server period <1-9999>`  
`no ntp designated-server period`

Parameter	Description
<1-9999>	The time adjustment period for the NTP server in minutes.

**Default** 10 minutes.

**Mode** Wireless AP Profile Configuration

**Example** To configure 30 minutes as the NTP server time adjustment period for ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# ntp designated-server
192.168.0.254
awplus(config-wireless-ap-prof)# ntp designated-server period
30
```

**Related commands** [ap-profile \(wireless\)](#)  
[show wireless ap-profile](#)

**Command changes** Version 5.4.7-2.4: command added.

# operating-class (wireless-network-passpoint-hs20)

**Overview** Use this command to set the Operating Class for Hotspot 2.0.  
Use the **no** variant of this command to revert to the default value.

**Syntax** `operating-class <HEX-value>`  
`no operating-class`

Parameter	Description
<code>&lt;HEX-value&gt;</code>	Operating Class Indication value in HEX. Refer to Table E-4 of IEEE Std 802.11-2012 Annex E

**Default** 51

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To set an Operating Class Indication value of 51, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)#
operating-class 51
```

**Related commands** [show wireless network](#)  
[hs20 \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# operator (wireless-network-passpoint-hs20)

**Overview** Use this command to configure the operator friendly name, unique entry number, and language code of a Hotspot 2.0 entry.

Use the **no** variant of this command to remove the configuration details of a Hotspot 2.0 entry.

**Syntax** `operator <operator-id> lang <language-code> friendly-name  
<friendly-name>`  
`no operator <operator-id>`

Parameter	Description
<code>&lt;operator-id&gt;</code>	The unique operator entry number. Select from the range 1-10.
<code>&lt;language-code&gt;</code>	The language code. You can use only 2 or 3 characters as specified in ISO-639. For example: English is 'eng', Japanese is 'jpn'.
<code>&lt;friendly-name&gt;</code>	The text field used to identify the Hotspot venue operator. You can use up to 252 octets of special characters (utf-8 encode). For example: "Allied Bld.5th floor".

**Default** Not set

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To configure the language code and operator friendly name on Operator ID 2, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# operator 2
lang eng friendly-name Allied-Telesis
```

**Related commands** [show wireless network](#)  
[hs20 \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# outdoor

**Overview** Use this command to designate that a wireless AP is located outdoors.  
Use the **no** variant of this command to designate when a wireless AP is not located outdoors.

**Syntax** outdoor  
no outdoor

**Default** No outdoor.

**Mode** Wireless AP Profile Configuration

**Usage notes** This command indicates whether the wireless AP is located outdoors, and selects the mode and channel that corresponds to this. To configure a channel number, use the **channel** command in **wireless-ap-prof-radio** mode. If you configure an invalid channel number, an error message displays the valid channels that you may select in your region.

The command is ignored when the AP is already configured using the **hwtype** command.

**Example** To configure an AP to be located outdoors, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# outdoor
```

**Related commands** [ap-profile \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

# page-proxy-url

**Overview** Use this command in Captive Portal mode to set the location of the custom page to display for web authentication. This page will be displayed instead of the wireless access point's built-in authentication or click-through page.

Use the **no** variant of this command to remove the URL pointing to the custom web authentication page.

**Syntax** `page-proxy-url <URL>`  
`no page-proxy-url`

Parameter	Description
<code>&lt;URL&gt;</code>	URL of external web server (hostname or dotted IP notation).

**Default** No custom page is set by default.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** This setting is valid only for AT-TQ5403, AT-TQm5403, AT-TQ5403e, AT-TQ1402, and AT-TQm1402 wireless access points.

**Example** To enable and set the web authentication proxy page, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# page-proxy-url
http://www.mydomain.com/login_page
```

**Command changes** Version 5.5.0-2.3: command added

# peer (wireless-wds)

**Overview** Use this command to add a pair of wireless Access Points (APs) to a WDS peer list. Use the **no** variant of this command to remove a pair of wireless APs from a WDS peer list.

**Syntax** peer ap <1-65535> radio <1-3> {ap <1-65535>|mac <mac-addr>}  
radio <1-3>  
no peer

Parameter	Description
ap	Signifies that the first AP identifier follows.
<1-65535>	The first AP identifier.
radio	Select the radio interface of the first AP.
<1-3>	Designate the radio interface for the first AP.
ap	Signifies that the second AP identifier follows.
<1-65535>	The second AP identifier.
mac	Signifies that the MAC address of the second AP follows.
<mac-addr>	The MAC address of the second AP. Enter the address in the format <HHHH.HHHH.HHHH> where <i>H</i> is a hexadecimal number.
radio	Select the radio interface of the second AP.
<1-3>	The radio interface for the second AP.

**Default** There are no APs configured in a WDS peer list by default.

**Mode** Wireless WDS Configuration

**Example** To add a pair of wireless APs to a WDS peer list, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# peer ap 10 radio 1 ap 20 radio 1
```

**Related commands** wds  
show wireless wds  
ap

**Command changes** Version 5.4.7-2.4: command added.

# permit host (wireless-ap-prof-snmp)

**Overview** Use this command to set the SNMP permit host for the target AP profile. This command is valid for SNMP v1 and v2c only.

Use the **no** variant of this command to remove the SNMP permit host from the AP profile.

**Syntax** permit host <host-name>  
no permit host

Parameter	Description
<host-name>	Respond only to SNMP requests from the specified host name. For example FQDN, IP address, or subnet mask (manager.your.domain.com, 10.10.1.37, 192.168.1.1/24).

**Default** Not set

**Mode** Wireless AP Profile SNMP Configuration

**Example** To set the SNMP permit host to '192.168.1.1', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# permit host 192.168.1.1
```

To remove the SNMP permit host '192.168.1.1', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no permit host
```

**Related commands** [show wireless ap-profile](#)  
[snmp \(wireless-ap-prof\)](#)  
[version \(wireless-ap-prof-snmp\)](#)

**Command changes** Version 5.5.0-2.1: command added

# port (wireless-ap-prof-snmp)

**Overview** Use this command to set the SNMP listening port number for the target AP profile. Use the **no** variant of this command to set the SNMP listening port back to the default (161).

**Syntax** `port <1-65535>`  
`no port`

Parameter	Description
<code>&lt;1-65535&gt;</code>	The SNMP listening port number to set.

**Default** 161

**Mode** Wireless AP Profile SNMP Configuration

**Example** To set the SNMP listening port to 166, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# port 166
```

To set the SNMP listening port back to the default (161), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no port
```

**Related commands** [show wireless ap-profile](#)  
[snmp \(wireless-ap-prof\)](#)

**Command changes** Version 5.5.0-2.1: command added

# power (wireless-ap-radio)

**Overview** Use this command to set the power level for client devices on a wireless Access Point (AP).  
Use the **no** variant of this command to return the power level to its default value.

**Syntax** `power <1-100>`  
`no power`

Parameter	Description
<code>&lt;1-100&gt;</code>	The percentage power level value.

**Default** A power level of 100% is the default.

**Mode** Wireless AP Radio Configuration

**Example** To set a power level of 30% for radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# power 30
```

**Related commands** [show wireless ap](#)  
[radio \(wireless-ap\)](#)

**Command changes** Version 5.4.7-2.4: command added

# pre-authentication enable (wireless-sec-osen)

**Overview** Use this command to allow wireless Access Points (APs) that have WPA2 clients to share the pre-authentication packets from the WPA2 clients with other APs.

When enabled, this speeds up authentication for roaming clients who connect to multiple APs.

Use the **no** variant of this command to disable pre-authentication

**Syntax** `pre-authentication enable`  
`no pre-authentication enable`

**Default** Enabled.

**Mode** Wireless Security OSEN Configuration

**Usage notes** OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint) OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

This command is not supported by WPA clients.

**Example** To disable pre-authentication for an OSEN security configuration, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# no pre-authentication enable
```

**Related commands** [security \(wireless\)](#)  
[show wireless security](#)

**Command changes** Version 5.5.0-2.3: command added

# pre-authentication enable (wireless-sec-wpa-ent)

**Overview** Use this command to enable WPA-enterprise pre-authentication for Access Points (APs) that have WPA2 clients.

Use the **no** variant of this command to disable WPA-enterprise pre-authentication.

**Syntax** `pre-authentication enable`  
`no pre-authentication enable`

**Default** Enabled.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** Enable this option if the AP has WPA2 clients and you want the AP to share the pre-authentication packets from the clients with other access points. If it is enabled, this can speed up authentication for roaming clients who connect to multiple access points. This option does not apply to WPA clients.

The MWS series of devices do not support pre-authentication, therefore, you should **disable** this command on these devices.

**Example** To disable pre-authentication on a WPA-enterprise configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# no pre-authentication
enable
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

# proxy-arp enable

**Overview** Use this command to enable proxy ARP on the wireless network. When Downstream Group-Addressed Forwarding (DGAF) is disabled, AlliedWare Plus enables Proxy ARP on the Access Points.

Use the **no** variant of this command to disable proxy ARP.

**Syntax** proxy-arp enable  
no proxy-arp enable

**Default** Disabled.

**Mode** Wireless Network Configuration

**Example** To enable Proxy ARP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# proxy-arp enable
```

**Related commands** [show wireless network](#)

**Command changes** Version 5.5.0-2.3: command added

# qos-map-set (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the QoS map set for 802.11u.  
Use the **no** variant of this command to revert to the default value.

**Syntax** `qos-map-set <qos-map>`  
`no qos-map-set`

Parameter	Description
<code>&lt;qos-map&gt;</code>	<p>QoS map configuration.</p> <ul style="list-style-type: none"><li>The QoS map is a comma delimited list of decimal values in the range 0-63 or 255.</li><li>The maximum number of elements in the list is 29. (21(DSCP Exception) + 8(User Priority). Refer to: IEEE Std 802.11-2012, 8.4.2.97.</li><li>Total length of QOSMAP &lt; 190.</li></ul> <p>Format: [&lt;DSCP Exceptions[DSCP,UP]&gt;,&lt;UP 0 range[low,high]&gt;,...&lt;UP 7 range[low,high]&gt;</p>

**Default** 0

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To configure the qos map set, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# qos-map-set

# radio (wireless-ap-profile)

**Overview** Use this command to enter AP profile radio configuration mode. Once in this mode, you can create and modify the radio configuration parameters for an AP profile.

**Syntax** radio <1-3>

Parameter	Description
<1-3>	The radio interface within the AP profile.

**Mode** Wireless AP Profile Configuration

**Example** To enter the AP profile radio configuration mode for interface 1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)#
```

# radius accounting enable

**Overview** Use this command to configure RADIUS accounting on Captive Portal with external RADIUS.

Use the **no** variant of this command to disable RADIUS accounting on Captive Portal.

**Syntax** radius accounting enable  
no radius accounting enable

**Default** Disabled.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** The server settings used by Captive Portal RADIUS accounting are those configured by the **radius auth group** command. The port number used is the same one set on the primary server by the command **radius-server host**.

**Example** To configure RADIUS accounting on Captive Portal for network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# radius accounting enable
```

**Related commands** captive-portal virtual-ip  
radius accounting enable  
radius auth group (wireless-network-cp)

**Command changes** Version 5.5.0-1.3: command added

# radius auth group (wireless-network-cp)

**Overview** Use this command to set the RADIUS server/s that wireless APs use for Captive Portal (web authentication).

Use the **no** variant of this command to remove the RADIUS server/s used for authentication.

**Syntax** `radius auth group {radius|<groupname>}`  
`no radius auth group {radius|<groupname>}`

Parameter	Description
<code>radius</code>	Use a RADIUS server registered with the <a href="#">radius-server host</a> command.
<code>&lt;groupname&gt;</code>	Use a RADIUS server that belongs to the specified server group. Use a server group created with the <a href="#">aaa group server radius</a> command.

**Default** No RADIUS server set by default.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** This setting is only valid for TQ series APs. It has no effect on MWS series APs.

**Example** To use the RADIUS group 'my\_rad' for Captive Portal authentication, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# mode radius
awplus(config-wireless-network-cp)# radius auth group my_rad
```

# radius authentication group (wireless-sec-osen)

**Overview** Use this command to assign a RADIUS server group for authenticating wireless AP clients using the OSEN security mode.

Use the **no** variant of this command to revert to the default RADIUS server group.

**Syntax** `radius auth group {radius|<group-name>}`  
`no radius auth group`

Parameter	Description
<code>radius</code>	Use RADIUS servers.
<code>&lt;group-name&gt;</code>	Use the RADIUS server group

**Default** RADIUS.

**Mode** Wireless Security OSEN Configuration

**Usage notes** The RADIUS server group is configured with the **aaa group server** command. The group name **radius** is predefined, which includes all RADIUS servers configured by the **radius-server host** command. However, this command, (**radius authentication group**) uses only the first two configured servers.

**Example** To configure the RADIUS authentication group to authenticate APs using the OSEN security mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# radius authentication group
radius
```

**Related commands** [radius-server host](#)  
[aaa group server](#)

**Command changes** Version 5.5.0-2.3: command added

# radius auth group (wireless-sec-wpa-ent)

**Overview** Use this command to set the RADIUS server group used to authenticate clients in a wireless WPA-enterprise.

Use the **no** variant of this command to set the RADIUS server group to the default.

**Syntax** `radius auth group {radius|<group-name>}`  
`no radius auth group`

Parameter	Description
<code>radius</code>	Use all RADIUS servers.
<code>&lt;group-name&gt;</code>	Server group name

**Default** RADIUS (all RADIUS servers).

**Mode** Wireless Security WPA-enterprise Configuration

**Example** To set **radius**, which means all RADIUS servers, to authenticate a wireless WPA-enterprise, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# radius auth group radius
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

# redirect-url

**Overview** Use this command to enable the redirect-url feature. After successful authentication this feature redirects the web browser to the URL specified in the command. If both [session-keep](#) and **redirect-url** are enabled, session-keep takes precedence.

Use the **no** variant of this command to disable the redirect-url feature.

**Syntax** `redirect-url <URL>`  
`no redirect-url`

Parameter	Description
<URL>	URL of page to redirect the user to (hostname or dotted IP notation).

**Default** Not set by default.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** This setting is valid only for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 APs. It has no effect on TQ2450, TQ3200, TQ3400, TQ3600 and MWS series APs.

**Example** To enable and set the redirect-url for Captive Portal authentication on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# redirect-url
http://www.mydomain.com/welcome
```

**Command changes** Version 5.4.9-1.1: command added

# rogue-ap-detection enable (wireless)

**Overview** Use this command to enable rogue application detection.  
Use the **no** variant of this command to disable rogue application detection.

**Syntax** `rogue-ap-detection enable`  
`no rogue-ap-detection enable`

**Default** Disabled.

**Mode** Wireless Configuration

**Example** To enable rogue application detection, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# rogue-ap-detection enable
```

**Related commands** [show wireless](#)

**Command changes** Version 5.4.7-2.4 command added.

# roaming-oi

## (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the Roaming Consortium List. A Roaming Consortium List contains multiple Organisation Identifiers (OIs) whose security credentials can be used to connect to a network.

Use the **no** variant of this command to revert to the default value.

**Syntax** `roaming-oi <oi-list>`  
`no roaming-oi`

Parameter	Description
<code>&lt;oi-list&gt;</code>	Roaming Consortium List. <ul style="list-style-type: none"><li>You can have multiple OIs in a list</li><li>Each OI is between 3 and 15 octets and is configured as a hexadecimal string.</li><li>Separate OIs with a comma.</li><li>The maximum number of OIs is 15.</li><li>The length of a character in the OI-List must be less than 465 including commas.</li></ul>

**Default** None

**Mode** Wireless Network Passpoint 802.11u Configuration

**Usage notes** The Roaming Consortium Element tell a mobile device which roaming consortiums or service providers are available through an AP.

**Example** To set a Roaming Consortium List containing two OIs, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# roaming-oi
021122,2233445566
```

**Related commands** [show wireless network](#)

**Command changes** Version 5.5.0-2.1: command added.

# sc-profile

**Overview** Use this command to add a Smart Connect profile configuration and enter the Smart Connect profile configuration mode.

Use the **no** variant of this command to remove a Smart Connect profile configuration.

**Syntax** `sc-profile <1-65535>`  
`no sc-profile`

Parameter	Description
<1-65535>	The Smart Connect profile ID.

**Default** Not set

**Mode** Wireless AP Profile Configuration

**Example** To add Smart Connect profile 1 to AP profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# sc-profile 1
```

**Related commands** [smart-connect-profile](#)  
[show wireless ap-profile](#)  
[show wireless network](#)

**Command changes** Version 5.5.0-0.1: command added

# sc-channel

**Overview** Use this command to set a fixed radio channel for an access point (AP) using Smart Connect.

Use the **no** variant of this command to delete this setting.

**Syntax** `sc-channel radio <1-3> channel {<channel-number>|auto}`  
`no sc-channel`

Parameter	Description
<1-3>	Select the radio channel fixed for AWC-SC use
<channel-number>	Select the radio channel that is defined in the AP profile
auto	The radio channel is automatically selected

**Default** Not set.

**Mode** Wireless Smart Connect Profile Configuration

**Example** To automatically configure the Smart Connect channel with AP profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# sc-channel radio 2 channel
auto
```

**Related commands** [smart-connect-profile](#)  
[show wireless ap](#)  
[show wireless ap-profile](#)

**Command changes** Version 5.5.0-0.1: command added

# security (wireless)

**Overview** Use this command to configure a wireless security instance and enter a configuration mode. If the instance doesn't already exist, then this command creates it. The command has four different types of configuration mode: OSEN, WEP, WPA-Personal, and WPA-Enterprise.

Use the **no** variant of this command to remove a wireless security instance.

**Syntax** `security <1-65535> mode {osen|wep|wpa-personal|wpa-enterprise}`  
`no security <1-65535>`

Parameter	Description
<1-65535>	Wireless security instance identification number
mode	Security mode
osen	Security mode OSEN. This assigns the configuration identifier to <b>config-wireless-sec-osen</b> mode and enters the mode.
wep	Security mode WEP. This assigns the configuration identifier to <b>config-wireless-sec-wep</b> mode and enters the mode.
wpa-personal	Security mode WPA-Personal. This assigns the configuration identifier to <b>config-wireless-sec-wpa-psnl</b> mode and enters the mode.
wpa-enterprise	Security mode WPA-Enterprise. This assigns the configuration identifier to <b>config-wireless-sec-wpa-ent</b> mode and enters the mode.

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** You create a wireless security instance by designating a security instance ID and selecting a security mode. There are four types of security modes:

- OSEN
- WEP
- WPA-Personal
- WPA-Enterprise

**Example** To configure and enter the wireless security mode for WPA-Personal, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)#
```

**Related  
commands**

**Command  
changes**

Version 5.4.7-2.4: command added  
Version 5.5.0-2.3: **osen** parameter added

# security (wireless-network)

**Overview** Use this command to designate a security configuration identifier for a wireless security configuration.  
Use the **no** variant of this command to remove a security configuration identifier.

**Syntax** `security <1-65535>`  
`no security`

Parameter	Description
<code>&lt;1-65535&gt;</code>	The wireless security configuration identifier.

**Default** Not set.

**Mode** Wireless Network Configuration

**Example** To assign a security configuration identifier of 10 to wireless network 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 2
awplus(config-wireless-network)# security 10
```

**Related commands** [network \(wireless\)](#)  
[show wireless network](#)

**Command changes** Version 5.4.7-2.4: command added.

# security (wireless-wds)

**Overview** Use this command to set a wireless security configuration identifier to the WDS configuration mode.

Use the **no** variant of this command to remove the WDS security configuration identifier.

**Syntax** `security <1-65535>`  
`no security`

Parameter	Description
<1-65535>	The wireless security configuration identifier.

**Default** Not set.

**Mode** Wireless WDS Configuration

**Example** To designate the wireless security configuration identifier to the WDS configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# security 2
```

**Related commands** [wds](#)  
[show wireless wds](#)

**Command changes** Version 5.4.7-2.4: command added

# service wireless

**Overview** Use this command to enable wireless services.  
Use the **no** version of the command to disable unused wireless services.

**Syntax** `service wireless`  
`no service wireless`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** On devices that support the wireless manage feature, sometimes it may be desirable to disable unused services, in order to reduce memory use. Disabling the wireless services will only take effect after you save the configuration and restart the device.

**Example** To disable the wireless service, use the commands:

```
awplus# configure terminal
awplus(config)# no service wireless
```

**Output** Figure 63-1: Example output from **no service wireless**

```
awplus(config)#no service wireless
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-0.1: command added

# session-keep

**Overview** Use this command to enable the session-keep feature. After successful authentication this feature redirects the web browser back to the originally requested URL. If both **session-keep** and [redirect-url](#) are enabled, session-keep takes precedence.

Use the **no** variant of this command to disable the session-keep feature.

**Syntax** `session-keep`  
`no session-keep`

**Default** Not set by default.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** This setting is valid only for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 APs. It has no effect on TQ2450, TQ3200, TQ3400, TQ3600 and MWS series APs.

**Example** To configure session-keep for Captive Portal authentication on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# session-keep
```

**Command changes** Version 5.4.9-1.1: command added

# session-key-refresh-interval

**Overview** Use this command to set the refresh interval for the session key used in a WPA-enterprise security configuration.  
Use the **no** variant of this command to set the refresh interval to the default.

**Syntax** `session-key-refresh-interval <0-86400>`  
`no session-refresh-key-interval`

Parameter	Description
<code>&lt;0-86400&gt;</code>	The refresh interval in seconds.

**Default** The default refresh interval is 0 seconds.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** This command is for TQ series devices only.

**Example** To set 7200 seconds as the session key refresh rate, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wep-ent)#
session-key-refresh-interval 7200
```

# show wireless ap

**Overview** Use this command to display the configuration and status of wireless Access Points (APs).

**Syntax** `show wireless ap {<ap-id-range>|all} [brief|status|detail]`

Parameter	Description
<ap-id-range>	Display the configuration and status for a selected AP or range of APs, <1-65535>.
all	Display the configuration and status of APs.
brief	Display the brief configuration details of APs.
status	Display the status of APs.
detail	Display the detailed status and device information of APs.

**Mode** Privileged Exec

**Example** To display the status and configuration of wireless APs, use the following commands:

```
awplus# show wireless ap
```

**Output** Figure 63-4: Example output from **show wireless ap**

# show wireless ap capability

**Overview** Use this command to display the configured specifications of a supported wireless Access Point (AP).

**Syntax** `show wireless ap capability`  
`show wireless ap capability hwtype <modelname>`  
`show wireless ap capability hwtype {tq|mws}`  
`[single|dual|triple] [spec {11ac|11n}] [radio {1|2|3}] [country`  
`<country-code>]`

Parameter	Description
hwtype	To specify the display of a hardware type. When omitted, all hardware types will be displayed.
<modelname>	The model name of the wireless AP capabilities to be displayed. See <a href="#">hwtype</a> for a full list of model names.
tq	Display hardware type AT-TQ series only.
mws	Display hardware type AT-MWS series only.
single	Display a single radio interface.
dual	Display a dual radio interface.
spec	To specify the display of an IEEE wireless networking standard mode. When omitted, all modes are displayed.
11ac	Display information for the 802.11ac mode only.
11n	Display information for the 802.11n mode only.
radio	To specify a radio bandwidth. When omitted, all radio bandwidths are displayed.
1	Display information for radio bandwidth 2.4GHz only.
2	Display information for radio 2 bandwidth 5GHz only.
3	Display information for radio 3 bandwidth 5GHz only.
country	To specify the display for a country. When omitted, the default country will be displayed.
<country-code>	Display the specified country code. The default country code is 'jp' for Japan or 'us' for other regions.

**Mode** User Exec and Privileged Exec

**Output** Figure 63-8: Example output from **show wireless ap capability**

# show wireless ap client

**Overview** Use this command to display the client information on a managed wireless Access Point (AP).

**Syntax** `show wireless ap [<ap-id-range>] client [radio <1-3>]`

Parameter	Description
<ap-id-range>	Display information for the selected Access Point, or range <1-65535>.
radio	Select a radio interface on the AP.
<1-3>	Radio interface number.

**Mode** User Exec and Privileged Exec

**Example** To display the wireless AP client settings, use the following commands:

```
awplus# show wireless ap client
```

**Output** Figure 63-9: Example output from **show wireless ap client**

```
awplus#show wireless ap client

**Related commands** [radio \(wireless-ap\)](#)

**Command changes** Version 5.4.7-2.4: command added

# show wireless ap neighbors

**Overview** Use this command to display the neighboring wireless Access Points (APs) connected to a radio or range of radios. If no parameters are specified, then all configurations are displayed.

**Syntax** `show wireless ap [<ap-id-range>|all] neighbors [radio <1-3>]`

Parameter	Description
<i>&lt;ap-id-range&gt;</i>	Show the radio and wireless neighbors associated with an AP or range of APs. To select a range, use the range format <i>&lt;1-65535&gt;</i> .
all	Display the radio and neighbors for all APs.
radio	Display the configured radio.
<i>&lt;1-3&gt;</i>	Radio interface number.

**Mode** User Exec and Privileged Exec

**Usage notes** If the total number of AP neighbors in the system exceeds 12500, this command will only show the first 12500 neighbors. You can specify the AP ID to see all neighbors of each AP.

**Example** To display all wireless AP neighbors, use the following command:

```
awplus# show wireless ap neighbors
```

**Output** Figure 63-10: Example output from **show wireless ap neighbors**

```
awplus#show wireless ap neighbors
```

# show wireless ap power-channel

**Overview** Use this command to display the currently configured status of an Access Point (AP) power-channel. If the command parameters are omitted, then the status for all APs will display.

**Syntax** `show wireless ap [<ap-id-range>|all] power-channel`

Parameter	Description
<ap-id-range>	Display the current power-channel status for a selected AP or range of APs in the format <1-65535>
all	Display the current power-channel status for all APs.

**Mode** User Exec and Privileged Exec

**Example** To display the currently configured power-channel status for APs, use the command:

```
awplus# show wireless ap power-channel
```

**Output** Figure 63-11: Example output from **show wireless ap power-channel**

```
awplus#show wireless ap power-channel

# show wireless ap-profile

**Overview** Use this command to display the AP-profile configuration for Autonomous Wave Control.

**Syntax** `show wireless ap-profile [<ap-profile-id-range>|all] [brief]`

Parameter	Description
<code>&lt;ap-profile-id-range&gt;</code>	Displays the AP-profile information for an ID range. The ID range is <1-65535>.
<code>all</code>	Displays all AP-profile configurations.
<code>brief</code>	Displays a brief summary of AP-profile configurations.

**Mode** User Exec and Privileged Exec

**Output** Figure 63-12: Example output from **show wireless ap-profile brief**

captive-portal virtual-ip

**Command changes** Version 5.4.7-2.4: command added

# show wireless captive-portal network walled-garden

**Overview** Use this command to display wireless network walled garden entries for Captive Portal.

**Syntax** `show wireless captive-portal {<network-ID>|all} walled-garden`

Parameter	Description
<code>&lt;network-ID&gt;</code>	Display output for the specified wireless network ID or range of network IDs, valid network IDs are <1- 65535>.
<code>all</code>	Display all wireless network walled garden entries.

**Mode** Privileged Exec

**Example** To display the walled garden entries for Captive Portal on network 5, use the commands:

```
awplus# show wireless captive-portal network 5 walled-garden
```

**Output** Figure 63-14: Example output from **show wireless captive-portal network 5 walled-garden**

**Command changes** Version 5.4.9-1.1: command added

# show wireless channel-blanket ap-profile status

**Overview** Use this command to display the channel blanket status of AP profiles. The command displays the number of channel blanket APs configured and visible from each AP to which the profile is assigned. An AP whose member is displayed as "-" is an AP that is not part of the channel blanket. If an AP Profile (or range) is not selected, then all APs profiles will be displayed.

**Syntax** `show wireless channel-blanket ap-profile {<profile-id> | all} status`

Parameter	Description
<profile-id>	The AP Profile ID, or range of IDs <1-65535>.
all	Display the status of all APs in the AP profile.

**Mode** Privileged Exec

**Example** To display the wireless channel blanket status for APs belonging to AP profile 100, use the following command:

```
awplus# show wireless channel-blanket ap-profile 100 status
```

**Output** Figure 63-16: Example output from **show wireless channel-blanket ap-profile**

# show wireless wds

**Overview** Use this command to display the configuration of a Wireless Distribution System (WDS) with Autonomous Wave Control. A WDS enables the wireless interconnection of Access Points (APs) or Peers in an IEEE802.11 network.

**Syntax** show wireless wds [*<wds-id-range>*] [brief]

Parameter	Description
<i>&lt;wds-id-range&gt;</i>	Display the configured information for a specified ID or a range of IDs. To display a range of WDS IDs, use the format <i>&lt;1-65535&gt;</i> .
brief	Display a brief summary of the WDS configuration.

**Mode** User Exec and Privileged Exec

**Example** To display the full detail of a WDS configuration for a wireless network, use the following command:

```
awplus# show wireless wds
```

**Output** Figure 63-28: Example output from **show wireless wds**

```

# show wireless wireless-trigger

**Overview** Use this command to display the wireless trigger status on a wireless network.

**Syntax** `show wireless wireless-trigger [all|<trigger-id>]`

Parameter	Description
<code>&lt;trigger-id&gt;</code>	Select an ID number between 1-8. You can also select a range of IDs using a comma separated list.

**Default** All

**Mode** Privileged Exec and User Exec

**Example** To display the status for all wireless triggers, use the commands:

```
awplus# show wireless wireless-trigger
```

**Output** Figure 63-31: Example output from **show wireless wireless-trigger**

```
awplus> show wireless wireless-trigger
Wireless Trigger ID 1:
 Description Trigger 1
 Status Inactive
Wireless Trigger ID 2:
 Description Trigger 2
 Status Active
 Activated User Admin
 Activated Time 2020-12-28 12:11:34
```

# smart-connect-profile

**Overview** Use this command to create a Smart Connect profile and enter the Smart Connect profile configuration mode.

Use the **no** variant of this command to delete a Smart Connect profile from the wireless configuration.

**Syntax** smart-connect-profile <1-65535>  
no smart-connect-profile <1-65535>

Parameter	Description
<1-65535>	The Smart Connect profile ID

**Default** Not set

**Mode** Wireless Configuration

**Example** To configure Smart Connect profile 10 and enter the Smart Connect profile configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)#
```

To delete Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no smart-connect-profile 10
```

**Related commands** show wireless ap-profile  
wireless  
smart-connect-profile  
auto-discovery disable  
show wireless ap-profile  
description (wireless-sc-prof)  
ssid (wireless-sc-prof)  
key (wireless-sc-prof)

**Command changes** Version 5.5.0-0.1: command added

# snmp (wireless-ap-prof)

**Overview** Use this command to enter SNMP configuration mode so you can add an SNMP configuration.

Use the **no** variant of this command to reset the SNMP parameters back to the default (not set).

**Syntax** snmp  
no snmp

**Default** Not set

**Mode** Wireless AP Profile Configuration

**Example** To enter the SNMP configuration mode of AP profile 2, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)#
```

To disable SNMP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# no snmp
awplus(config-wireless-ap-prof)#
```

- [version \(wireless-ap-prof-snmp\)](#)

**Command changes** Version 5.5.0-2.1: command added

# ssid (wireless-network)

**Overview** Use this command to configure the SSID (Service Set Identifier) for the wireless network.

**Syntax** `ssid <value>`

Parameter	Description
<code>&lt;value&gt;</code>	The unique alphanumeric description or name of the SSID. The maximum character length is 32.

**Default** Default- {NETWORKID}.

Except for the default Guest Network, the default SSID for each network is 'Default-' followed by the unique Network ID.

**Mode** Wireless Network Configuration

**Usage notes** A network must be configured with an SSID of one or more alphanumeric characters. The SSID can be modified, but cannot be deleted.

**Example** To configure a SSID name for a wireless network, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# ssid GUEST_NETWORK_1
```

**Related commands** [network \(wireless\)](#)  
[show wireless network](#)

**Command changes** Version 5.4.7-2.4: command added.

# ssid (wireless-sc-prof)

**Overview** Use this command to set the SSID used for wireless communication between APs in a Smart Connect network.

Use the **no** variant of this command to remove the SSID from a Smart Connect profile.

**Syntax** `ssid <ssid-value>`  
`no ssid`

Parameter	Description
<code>&lt;ssid-value&gt;</code>	The SSID for the Smart Connect network. Enter a string up to 32 characters in length.

**Default** Not set

**Mode** Wireless Smart Connect Profile Configuration

**Example** To set the SSID ID of 10 used for wireless communication between APs in Smart Connect network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 20
awplus(config-wireless-sc-prof)# ssid SC-NETWORK-10
```

**Related commands** [sc-profile](#)

**Command changes** Version 5.5.0-0.1: command added

# station-isolation enable

**Overview** Use this command to enable to the station-isolation option on channel blanket for a wireless AP profile. When station-isolation is enabled, the AP blocks communication between wireless clients on the same virtual access point (VAP). The AP still allows data traffic between its wireless clients and wired devices on the network.

Use the **no** variant of this command to disable the station-isolation option.

**Syntax** station-isolation enable  
no station-isolation enable

**Default** Disabled.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Example** To enable station-isolation for channel blanket on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# station-isolation enable
```

**Related commands** [ap-profile \(wireless-ap\)](#)  
[show wireless ap-profile](#)  
[channel-blanket](#)

**Command changes** Version 5.4.9-1.1: command added

# station-isolation enable (wireless-ap-prof-radio)

**Overview** Use this command to enable the **station-isolation** option. This option designates whether to allow communication between wireless clients which are connected to the same Virtual Access Point (VAP).

Use the **no** variant of this command to disable the station-isolation option on a selected VAP.

**Syntax** station-isolation enable  
no station-isolation enable

**Default** Disabled.

**Mode** Wireless AP Profile Radio Configuration

**Example** To enable the station-isolation option for **radio 2** on **ap-profile100**, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# station-isolation
enable
```

**Related commands** [radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# task

**Overview** Use this command to configure an Autonomous Wave Control (AWC) task. If the task doesn't exist, then this command creates it. Use the **no** variant of this command to remove the task.

**Syntax** task <1-65535>  
no task <1-65535>

Parameter	Description
<1-65535>	Task ID number

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** A task is a configuration for a periodic or scheduled action to be taken. For example, the task may be to run a configuration, start an AWC calculation, or download AP firmware. Use commands such as **description**, **time**, and **day** to configure the task actions.

**Example** To add a task with an ID of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 10
```

To remove task ID 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no task 10
```

**Related commands** enable (wireless-task)  
description (wireless-task)  
time (wireless-task)  
day (wireless-task)  
type download ap (wireless-task)  
type ap-configuration apply ap

**Command changes** Version 5.4.7-2.4: command added

# time (wireless-task)

**Overview** Use this command to set a time to run a task using the 24-hour format. You can use the **day** command along with the **time** command to more fully set the task run time configuration. Use the **no** variant of this command to remove the time set to run a task.

**Syntax** `time <HH:MM>`  
`no time`

Parameter	Description
<HH:MM>	The time set to run a task in 24-hour time format.

**Default** Not set.

**Mode** Wireless Task Configuration

**Example** To set task 5 to run at 11:15 pm, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# time 23:15
```

**Related commands** [task](#)  
[show wireless task](#)  
[day \(wireless-task\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# trap host (wireless-ap-prof-snmp)

**Overview** Use this command to add an SNMP trap host to the entry for the target AP Profile. Use the **no** variant of this command to remove the specified SNMP trap host from the entry.

**Syntax**

```
trap host <host-name>
no trap host <host-name>
```

Parameter	Description
<host-name>	The host that sends the SNMP trap. Specify the host name (FQDN) or IP address. For example manager.your.domain.com, 10.10.1.37.

**Default** The entry is empty.

**Mode** Wireless AP Profile SNMP Configuration

**Usage notes** The maximum number of registrations is 3 entries.

**Example** To add the SNMP trap host 192.168.1.1 to the entry, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# trap host 192.168.1.1
```

To remove the SNMP trap host 192.168.1.1 from the entry, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no trap host 192.168.1.1
```

**Related commands**

- [snmp \(wireless-ap-prof\)](#)

**Command changes** Version 5.5.0-2.1: command added

# type (wireless-sec-wep)

**Overview** Use this command to assign the key-string type for a wireless security WEP configuration.

Use the **no** variant of this command to reset the assigned WEP key-string type to the default.

**Syntax** type {ascii|hex}  
no type

Parameter	Description
ascii	Use ASCII as the type for the WEP key
hex	Use Hex as the type for the WEP key

**Default** Hex.

**Mode** Wireless Security WEP Configuration

**Example** To configure ASCII as the key-string type for WEP for a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# type ascii
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# type ap-configuration apply ap

**Overview** Use this command to apply a task configuration type to a selected wireless Access Point (AP) or range of wireless APs.

**Syntax** `type ap-configuration apply ap {all|<ap-id-range>}`

Parameter	Description
all	Apply the configuration to all APs.
<ap-id-range>	Apply the configuration to a selected range of APs.

**Default** Not set.

**Mode** Wireless Task Configuration

**Example** To assign task 5 configuration to wireless AP ranges: 5-9 and 15-19, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# type ap-configuration apply ap
5-9,15-19
```

**Related commands**

- [task](#)
- [show wireless task](#)
- [ap](#)
- [type download ap \(wireless-task\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# type download ap (wireless-task)

**Overview** Use this command to download and update wireless Access Point (AP) firmware. The firmware must be stored on an HTTP server.

**Syntax** `type download ap {all|<ap-id-range>} url <URL> [username <user-name> password <password>]`

Parameter	Description
all	Run the task on all managed APs.
<ap-id-range>	Run the task on the selected identifier.
<URL>	The URL where the firmware is stored and can be downloaded from.
<user-name>	The username requiring authentication and access to the URL.
<password>	The password requiring authentication and access to the URL.

**Mode** Wireless Task Configuration

**Example** To set a task to download new firmware from the IP address 192.168.0.1 to a wireless AP which is assigned '7' as its identifier, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# type download ap 7 url
http://192.168.0.1/AT-TQ4600-4.0.3.b02.img
```

**Related commands**

- [task](#)
- [show wireless task](#)
- [ap](#)
- [type ap-configuration apply ap](#)
- [type power-channel ap all](#)

**Command changes** Version 5.4.7-2.4: command added.

# type power-channel ap all

**Overview** Use this command to calculate the power usage on wireless Access Point (AP) channels and apply the results manually or automatically.

**Syntax** `type power-channel ap all {calculate|apply|calculate-and-apply}`

Parameter	Description
<code>calculate</code>	Run the AWC power calculation on all APs.
<code>apply</code>	Apply the latest AWC power calculation results to all APs.
<code>calculate-and-apply</code>	Run the AWC power calculation and apply the results to all APs.

**Default** Not set.

**Mode** Wireless Task Configuration

**Usage notes** This command allows you to monitor how APs are being utilized at various times and adjust AP power levels if required.

**Example** To calculate all AP power-channel usage and apply the results to all APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config)# type power-channel ap all calculate-and-apply
```

# unauth-emergency-service-access enable (wireless-network-passpoint-dot11u)

**Overview** Use this command to configure unauthenticated access to emergency services. This makes emergency services available to any user, with or without a valid authentication credential.

Use the **no** variant of this command to disable unauthenticated access to emergency services.

**Syntax** `unauth-emergency-service-access enable`  
`no unauth-emergency-service-access enable`

**Default** Disabled.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To configure unauthenticated access to emergency services, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
unauth-emergency-service-access enable
```

**Related commands** [show wireless network](#)  
[dot11u \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# username (wireless-ap-prof-snmp)

**Overview** Use this command to set an SNMP version v3 username and password for the target AP profile. This command is valid for SNMP version v3 only.

Use the **no** variant of this command to remove an SNMP username and password.

**Syntax** `username <username> password [encrypted] <password>`  
`no username`

Parameter	Description
<username>	The user name that is used for user authentication and encryption. Enter up to 12 alphanumeric characters. The user name cannot begin with a number.
encrypted	Indicates that the following password is in its encrypted form. Its primary purpose is to use to store the shared key to startup-configuration. You should not use it when entering the command manually.
<password>	The password is used for encryption. Enter from 8 to 32 characters. Valid characters are: - alphanumeric characters - symbols except for the following 8 symbols: " \$ & ' * : < >

**Default** Not set

**Mode** Wireless AP Profile SNMP Configuration

**Example** To set the SNMP username to 'manager' and the password to 'friend001', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# username manager
awplus(config-wireless-ap-prof-snmp)# password friend001
```

To remove the SNMP username and password, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof)# no username
```

**Related commands**

- community read-only (wireless-ap-prof-snmp)

**Command changes**

- Version 5.5.1-1.1: valid character set for password changed
- Version 5.5.0-2.1: command added

# vap

**Overview** Use this command to assign a network configuration ID to a Virtual Access Point (VAP) on the radio.

Use the **no** variant of this command to remove a specific VAP configuration.

**NOTE:** The channel-blanket setting can only be used with AT-TQ5403 and AT-TQ5403e APs. If this is set for other APs, you will not be able to manage those APs. Also, even if the AP profile for AT-TQ5403 or AT-TQ5403e does not include the Channel Blanket setting, those AT-TQ5403 or AT-TQ5403e will not be manageable.

**Syntax** `vap <vap-id> network <network-id> [channel-blanket]`  
`no vap <vap-id>`

Parameter	Description
<vap-id>	Enter the VAP ID in the range of <0-7>
<network-id>	Enter the network ID in the range of <1-65535>
channel-blanket	Set the VAP to channel blanket mode

**Default** Not set.

**Mode** Wireless AP Profile Radio Configuration

**Example** To associate a network (ID 100) with the VAP 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# vap 2 network 100
```

To associate a network (ID 100) with the VAP 2 as channel blanket mode, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# vap 2 network 100
channel-blanket
```

**Related commands** [network \(wireless\)](#)  
[radio \(wireless-ap-profile\)](#)  
[show wireless channel-blanket ap status](#)

show wireless channel-blanket ap-profile status

**Command changes** Version 5.4.9-1.1: command added

# vap network (wireless-ap-prof-radio)

**Overview** Use this command to assign a network configuration ID to a Virtual Access Point (VAP) on a radio.

Use the **no** variant of this command to remove the network configuration for a VAP.

**Syntax** vap <0-7> network <1-65535>  
no vap <0-7>

Parameter	Description
<0-7>	VAP identification number
<1-65535>	Network configuration of the designated VAP

**Default** Not set.

**Mode** Wireless AP Profile Radio Configuration

**Usage notes** vap0 is the only VAP identification number valid on the **MWS series**.

**Example** To associate an AP with network (ID 100) to VAP 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# vap 2 network 2
```

**Related commands** [radio \(wireless-ap-profile\)](#)  
[network \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# venue group (wireless-network-passpoint-dot11u)

**Overview** Use this command to designate the venue group used in a Passpoint 802.11u wireless configuration.

Use the **no** variant of this command to reset a venue group.

**Syntax** venue group <0-255>  
no venue group

Parameter	Description
<0-255>	The venue group code. See IEEE 802.11-2016, Table 9-61 page 756.

**Default** 7

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To set a venue group, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# venue group
2
```

**Related commands** [show wireless network](#)

**Command changes** Version 5.5.1-1.1: command added.

# venue name (wireless-network-passpoint-dot11u)

**Overview** Use this command to designate the venue name and language code used in a Passpoint 802.11u wireless configuration.

Use the **no** variant of this command to remove a venue name.

**Syntax** venue name <1-10> lang <lang-code> name <venue-name>  
no venue name <1-10>

Parameter	Description
<1-10>	The venue name identifier number. If the specified identifier number does not exist, then a new one will be created. If it does exist, the language code and venue name will be overwritten.
<lang-code>	The language code. The code is 2 or 3 characters as specified in ISO-639. For example, 'eng', 'jpn'
<venue-name>	The venue name. <ul style="list-style-type: none"><li>You can enter up to 10 separate entries</li><li>The maximum number of characters is 252.</li></ul>

**Default** No name is set

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To set a venue name, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# venue name 1
lang eng name Allied Telesis Ltd
```

**Related commands** [show wireless network](#)

**Command changes** Version 5.5.1-1.1: command added.

# venue type

## (wireless-network-passpoint-dot11u)

**Overview** Use this command to designate the venue type used in a Passpoint 802.11u wireless configuration.

Use the **no** variant of this command to reset a venue type.

**Syntax** `venue type <0-255>`  
`no venue type`

Parameter	Description
<code>&lt;0-255&gt;</code>	The venue type code. See IEEE 802.11-2016, Table 9-62 page 756-759.

**Default** 1

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To set a venue type, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# venue type 2
```

**Related commands** [show wireless network](#)  
[venue group \(wireless-network-passpoint-dot11u\)](#)

**Command changes** Version 5.5.1-1.1: command added.

# version (wireless-ap-prof-snmp)

**Overview** Use this command to set the SNMP agent version for the target AP profile.  
Use the **no** variant of this command to set it back to the default (v1 and v2c).

**Syntax** `version {v1v2c|v3}`  
`no version`

Parameter	Description
v1v2c	Set when the SNMP agent version is at v1 or v2c.
v3	Set when the SNMP agent version is v3.

**Default** v1v2c

**Mode** Wireless AP Profile SNMP Configuration

**Example** To set the SNMP version as v3, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# version v3
```

To set the SNMP listening port back to the default (v1v2c), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no version
```

**Command changes** Version 5.5.0-2.1: command added

# versions (wireless-sec-osen)

**Overview** Use this command to set which Wi-Fi Protected Access (WPA) version to use with OSEN wireless security configuration. OSEN is Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. It is used with Release 2 of Hotspot 2.0 (Passpoint).

Use the **no** variant of this command to revert to the default setting (WPA2).

**Syntax** `versions <version-list>`  
`no versions`

Parameter	Description
<code>&lt;version-list&gt;</code>	The supported WPA version(s) list. The list can use either <b>wpa</b> or <b>wpa2</b> or <b>wpa3</b> , or two of these three, or all in any order. OSEN only allows the following combinations: <ul style="list-style-type: none"><li>• two combinations of <b>wpa</b> and <b>wpa2</b></li><li>• <b>wpa</b> only</li><li>• <b>wpa3</b> only</li></ul>

**Default** WPA2.

**Mode** Wireless Security OSEN Configuration

**Usage notes** OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint) OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

**Example** To set both WPA and WPA2 as WPA versions on a security configuration of OSEN, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# versions wpa wpa2
```

**Related commands** [show wireless security](#)

**Command changes** Version 5.5.0-2.3: command added

# versions (wireless-sec-wpa-ent)

**Overview** Use this command to set the WPA version used for a WPA-enterprise wireless security configuration.

Use the **no** variant of this command to reset the designated version to the default.

**Syntax** `versions <version-list>`  
`no versions`

Parameter	Description
<code>&lt;version-list&gt;</code>	The version list. You can use either <b>wpa</b> , <b>wpa2</b> , <b>wpa3</b> , or any combination of the three in any order.

**Default** `wpa2`.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions WPA2 and ciphers CCMP
- versions WPA, WPA2, and ciphers TKIP and CCMP

WPA3 is only supported on TS5403 series devices.

**Example** To configure both WPA and WPA2 as WPA versions on a security configuration for WPA-enterprise, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# versions wpa wpa2
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.  
Version 5.4.9-1.1: **wpa3** parameter added.

# versions (wireless-sec-wpa-psnl)

**Overview** Use this command to set the WPA version used for a WPA-personal wireless security configuration.  
Use the **no** variant of this command to reset the designated version to the default.

**Syntax** `versions <version-list>`  
`no versions`

Parameter	Description
<code>&lt;version-list&gt;</code>	The version list. You can use either <b>wpa</b> , <b>wpa2</b> , <b>wpa3</b> , or any combination of the three in any order.

**Default** `wpa2`.

**Mode** Wireless Security WPA-personal Configuration

**Usage notes** For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions WPA2 and ciphers CCMP
- versions WPA, WPA2, and ciphers TKIP and CCMP

WPA3 is only supported on TS5403 series devices.

**Example** To configure both WPA and WPA2 as WPA versions on a security configuration for WPA-personal, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# versions wpa wpa2
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.  
Version 5.4.9-1.1: **wpa3** parameter added.

# vlan (wireless-network)

**Overview** Use this command to configure the wireless VLAN that clients belong to.  
Use the **no** variant of this command to reset the wireless VLAN to the default.

**Syntax** `vlan <1-4094>`  
`no vlan`

Parameter	Description
<1-4094>	VLAN ID number.

**Default** VLAN1.

**Mode** Wireless Network Configuration

**Example** To configure a VLAN ID, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# vlan 100
```

To restore VLAN 20 to its default value, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no vlan
```

**Related commands** [network \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

# walled-garden entry

**Overview** Use this command to configure walled garden entry to a wireless network Captive Portal.

On the Internet, a walled garden typically controls a user's access to web content and services. The walled garden directs the user's navigation within particular areas to allow access to a selection of websites or prevent access to other websites.

A common example could be a hotel environment where unauthenticated users are allowed to navigate to a designated login page (for example, a hotel website) and all its contents.

Use the **no** variant of this command to remove a walled garden on a wireless network that's configured with a Captive Portal.

**Syntax** `walled-garden entry {A.B.C.D|A.B.A.D/M|FQDN}`  
`no walled-garden entry {A.B.C.D|A.B.A.D/M|FQDN}`

Parameter	Description
A.B.C.D	IPv4 address format, e.g. 1.1.1.1
A.B.C.D/M	IPv4 address format with subnet mask, e.g. 1.1.1.0/24
FQDN	FDQN format. Sequence of {LETTER/DIGIT/HYPHEN}.{LETTER/DIGIT/HYPHEN}...while each dotted part of the name (aa or bb or cc in this example) MUST NOT end with HYPHEN and the first character MUST be a LETTER or a DIGIT. And each dotted part (aa or bb or cc in this example) must be 63 characters or less, e.g. example.com www.example.com

**Default** Not set

**Mode** Wireless Network Captive Portal Configuration

**Example** To add a new entry to a walled garden list on Captive Portal for network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# walled-garden entry
example.com
```

# wan-metrics downlink-load (wireless-network-passpoint-hs20)

**Overview** Use this command to set the wan-metrics downlink-load for Hotspot 2.0.  
Use the **no** variant of this command to revert to the default value.

**Syntax** wan-metrics downlink-load <0-255>  
no wan-metrics downlink-load

Parameter	Description
<0-255>	WAN Metrics Down Link Load value Calculation formula: WAN line load factor (%) /100*255 For example: 75% -> 75/100*255=191

**Default** 80.

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To set a WAN Metrics Down Link Load of 191, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# wan-metrics
downlink-load 191
```

**Command changes** Version 5.5.0-2.3: command added

# wan-metrics downlink-speed (wireless-network-passpoint-hs20)

**Overview** Use this command to set the wan-metrics downlink-speed for Hotspot 2.0.  
Use the **no** variant of this command to revert to the default value.

**Syntax** wan-metrics downlink-speed <1-4294967295>  
no wan-metrics downlink-speed

Parameter	Description
<1-4294967295>	WAN Metrics Down Link Speed (kbps)

**Default** 8000.

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To set a WAN Metrics Down Link Speed of 191 kbps, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# wan-metrics

# wan-metrics info (wireless-network-passpoint-hs20)

**Overview** Use this command to configure the WAN Metrics Link Status information for Hotspot 2.0.

Use the **no** variant of this command to revert to the default value.

**Syntax** wan-metrics info <HEX-value>  
no wan-metrics info

Parameter	Description
<HEX-value>	A one or two digit hexadecimal number.
	Calculation formula: . <ul style="list-style-type: none"><li>• (At Capacity &lt;&lt; 3)   (Symmetric Link &lt;&lt; 2)   (Link Status &amp; 0x3)</li></ul> Bit placement: <ul style="list-style-type: none"><li>• Bit[3]: At Capacity</li><li>• Bit[2]: Symmetric Link</li><li>• Bit[1:0]: Link Status</li></ul> <b>At Capacity:</b> Set to 1 to notify you that the line capacity on the WAN side has reached the upper limit. <b>Symmetric Link:</b> Set to 1 to notify you that Uplink/Downlink speed are the same value. <b>Link Status:</b> Configure as shown below: <ul style="list-style-type: none"><li>• 1 (0b01) : Link up</li><li>• 2 (0b10) : Link down</li><li>• 3 (0b11) : Link in test state</li></ul>

**Default** 01

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To set the WAN Metrics Link Status information, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# wan-metrics
info 01
```

# wan-metrics load-measure-duration (wireless-network-passpoint-hs20)

**Overview** Use this command to set the wan-metrics load measure-duration for Hotspot 2.0.  
Use the **no** variant of this command to revert to the default value.

**Syntax** wan-metrics load-measure-duration <0-65535>  
no wan-metrics load-measure-duration

Parameter	Description
<0-65535>	WAN Metrics Load Measure Duration value Calculation formula: Measurement interval (seconds)*10 For example: 2 second interval -> 2*10=20

**Default** 3000.

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To set a WAN Metrics Load Measure Duration value of 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# wan-metrics

# wan-metrics uplink-load (wireless-network-passpoint-hs20)

**Overview** Use this command to set the wan-metrics uplink-load for Hotspot 2.0.  
Use the **no** variant of this command to revert to the default value.

**Syntax** wan-metrics uplink-load <0-255>  
no wan-metrics uplink-load

Parameter	Description
<0-255>	WAN Metrics Up Link Load value Calculation formula: WAN line load factor (%) /100*255 For example: 75% -> 75/100*255=191

**Default** 240.

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To set a WAN Metrics Up Link Load of 191, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20

# wds

**Overview** Use this command to add a Wireless Distribution System (WDS) configuration. Use the **no** variant of this command to remove a WDS configuration.

**Syntax** `wds <1-65535>`

Parameter	Description
<code>&lt;1-65535&gt;</code>	WDS configuration ID number.

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** This command adds a WDS configuration and enters the configuration mode.

**Example** To add a WDS configuration for AWC, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
```

To remove a WDS configuration for AWC, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wds 10
```

**Related commands**

## wds radio (wireless-ap)

**Overview** Use this command to designate a radio interface for an Access Point (AP) in a Wireless Distribution System (WDS) network.

Use the **no** variant of this command to remove a wireless radio interface.

**Syntax** `wds radio <1-3>`  
`no wds radio`

Parameter	Description
<1-3>	Designate a radio interface for the WDS connection.

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To configure 'radio 2' as the radio interface for a WDS connection, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# wds radio 2
```

**Related commands** [ap](#)

# web-auth radius auth group

**Overview** Use this command to enable Web authentication of clients with a RADIUS group in a wireless network.

Use the **no** variant of this command to disable Web authentication with a RADIUS group.

**Syntax** `web-auth radius auth group {radius|<group-name>}`  
`no web-auth radius auth group`

Parameter	Description
<code>radius</code>	Use a RADIUS group, which means <b>all</b> RADIUS servers.
<code>&lt;group-name&gt;</code>	The RADIUS server group.

**Default** Not set.

**Mode** Wireless Network.

**Usage notes** This command enables Web authentication and designates a RADIUS server group to authenticate clients on a wireless network. RADIUS server groups are defined using the **aaa group server** command. RADIUS server groups can consist of multiple server hosts, but this command only uses two servers.

**Example** To enable Web authentication with a RADIUS server group, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# web-auth radius auth group
radius
```

**Related commands** [aaa group server](#)  
[network \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless

**Overview** Use this command to enter wireless configuration mode.  
Use the **no** variant of this command to exit wireless configuration mode.

**Syntax** wireless  
no wireless

**Mode** Global Configuration

**Example** To enter wireless configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)#
```

**Command changes** Version 5.4.7-2.4: command added.

# wireless ap-configuration apply ap

**Overview** Use this command to apply a configuration to a single Access point (AP) or a range of APs. The configuration must exist before you use this command.

**Syntax** `wireless ap-configuration apply ap {all|<ap-idrange>}`

Parameter	Description
all	Apply the configuration to all APs.
<ap-idrange>	Apply the configuration to a range of APs. The range format is 1-65535.

**Mode** Privileged Exec

**Example** To apply a configuration to the AP range 1-10, use the command:

```
awplus# configure terminal
awplus(config)# wireless ap-configuration apply 1-10
```

To apply a configuration to all APs, use the command:

```
awplus# wireless ap-configuration apply ap all
```

**Related commands** [ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless channel-blanket ap-profile bssid-renew

**Overview** Use this command to renew the BSSID assigned to the channel blanket for the specified AP-profile(s).

**Syntax** `wireless channel-blanket ap-profile  
{<ap-profile-id-range>|all} bssid-renew`

Parameter	Description
<code>&lt;ap-profile-id-range&gt;</code>	Renew the BSSID of the channel blanket for a specific AP-profile or range of AP-profiles <1-65535>.
<code>all</code>	Renew the BSSID of the channel blanket for all AP-profiles.

**Default** Not set.

**Mode** Privileged Exec

**Example** To renew the channel blanket BSSID for AP-profile 1 and 2, use the commands:

```
awplus# wireless channel-blanket ap-profile 1,2 bssid-renew
```

**Related commands** [show wireless ap-profile](#)  
[vap](#)

**Command changes** Version 5.5.1-0.1: command added

# wireless download ap url

**Overview** Use this command to download Access Point (AP) firmware from a URL.

**Syntax** wireless download ap {all|<aprange>} url [username <user-name>  
password <password>]

Parameter	Description
all	All APs.
<aprange>	A range of APs <1-65535>
username <user-name>	The login username.  The username can contain: <ul style="list-style-type: none"><li>• up to 255 characters.</li><li>• any printable ASCII characters (ASCII 32-126)</li><li>• special characters: backslash, double-quote or space, but they should be escaped with a backslash.</li></ul>
password <password>	Passwords can be up to 64 characters in length and can contain printable characters, except: <ul style="list-style-type: none"><li>• ?</li><li>• "(double quotes)</li><li>• space</li></ul>

**Default** Not set.

**Mode** Privileged Exec

**NOTE:** AWC supports the following firmware version:

- TW series: v4.0.5B02
- MWS2533AP: v2.2.1, v2.2.3
- MWS600AP/MWS1750AP: v2.2.3

**Example** To download new firmware to all APs from the URL 192.168.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless download ap all url
http://192.168.0.1/AT-TQ4600-4.0.3.n.b02.img
```

**Related commands** [show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless emergency-mode

**Overview** Use this command to activate or deactivate AWC emergency mode. Wireless networks that have been flagged for emergency-mode are activated or deactivated when this command is configured.

**Syntax** `wireless emergency-mode {activate|deactivate}`

**Default** Deactivated

**Mode** Privileged Exec

**Example** To activate the emergency mode in AWC, use the command:

```
awplus# wireless emergency-mode activate
```

**Related commands** [emergency-mode](#)  
[show wireless](#)

**Command changes** Version 5.5.0-0.3: command added

# wireless export

**Overview** Use this command to export MAC filter entries to a CSV file. If the specified file does not exist, it will be created. If the file does exist then it will be overwritten with the new data.

**Syntax** `wireless export wireless-mac-filter <mac-filter-id> <url>`

Parameter	Description
<code>&lt;mac-filter-id&gt;</code>	<code>&lt;1-65535&gt;</code> The ID of the MAC filter to export.
<code>&lt;url&gt;</code>	Path and filename of the export file.

**Mode** Privileged Exec

**Example** To export MAC filter '20' to a CSV file named 'whitelist.csv', use the following command:

```
awplus# wireless export wireless-mac-filter 20
flash://whitelist.csv
```

Figure 63-32: Sample export file:

```
"00:1a:eb:12:34:56","client1"
"00:1a:eb:12:34:57","client2"
"00:1a:eb:12:34:58","client3"
"00:1a:eb:12:34:59","client4"

# wireless import

**Overview** Use this command to import MAC filter entries from a CSV file. The imported entries can either replace or be appended to the existing entries.

**Syntax** `wireless import <url> wireless-mac-filter <mac-filter-id> {add|replace}`

Parameter	Description
<url>	Path and filename of the import file.
<mac-filter-id>	<1-65535> The ID of the MAC filter to import the entries to.
add	Add the filter entries to the specified MAC filter
replace	Overwrite the existing MAC filter with the imported entries.

**Mode** Privileged Exec

**Example** To add MAC filter entries from the file 'whitelist.csv' to MAC filter '20', use the following command:

```
awplus# wireless import flash://whitelist.csv
wireless-mac-filter 20 add
```

Figure 63-33: Sample import file:

```
"00:1a:eb:12:34:56","client1"

# wireless power-channel ap all

**Overview** This command activates AWC to calculate the optimal power-channel levels for all the Access Points (APs) in a wireless network. You can use this command to calculate and apply the latest AWC calculation results to the APs automatically or you can choose to apply them manually.

**Syntax** `wireless power-channel ap all  
{calculate|apply|calculate-and-apply}`

Parameter	Description
<code>calculate</code>	Use AWC to calculate the optimal power-channel levels for all APs.
<code>apply</code>	Apply the latest AWC optimal power-channel level results to all APs.
<code>calculate-and-apply</code>	Use AWC to calculate the optimal power-channel levels for all APs, and apply the results to the APs.

**Default** Not set.

**Mode** Privileged Exec

**Example** To activate AWC to calculate the optimal power-channel levels for all APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless power-channel ap all calculate
```

To apply the latest optimal power-channel results manually to all APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless power-channel ap all apply
```

To activate AWC to calculate the optimal power-channel levels for all APs and then automatically apply the results to the APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless power-channel ap all
calculate-and-apply
```

**Related commands** [show wireless ap power-channel](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless reset ap

**Overview** Use this command to reset the current configuration applied to a wireless Access Point (AP).

**Syntax** `wireless reset ap {all|<aprange>}`

Parameter	Description
<aprange>	Reset the range of APs in the format <1-65535>
all	Reset all APs.

**Mode** Privileged Exec

**Example** To reset the configuration for wireless APs in the range 1-10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless reset ap 1-10
```

To reset the configuration for all wireless APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless reset ap all
```

**Related commands** [ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless-mac-filter (wireless)

**Overview** Use this command to configure a wireless MAC filter. If the filter does not already exist it will be created when you issue this command.

Use the **no** variant of this command to remove a wireless MAC filter.

**Syntax** `wireless-mac-filter <mac-filter-id>`  
`no wireless-mac-filter <mac-filter-id>`

Parameter	Description
<code>&lt;mac-filter-id&gt;</code>	<code>&lt;1-65535&gt;</code> Enter the ID of the MAC filter to assign to the AP profile.

**Default** No MAC filters are set by default.

**Mode** Wireless Configuration

**Example** To add a MAC filter with ID '20' and enter configuration mode for that filter, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)#
```

To remove a MAC filter with ID '20', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wireless-mac-filter 20
```

# wireless-mac-filter (wireless-ap-prof)

**Overview** Use this command to assign a MAC filter to a wireless AP profile. You can configure the filter as a 'whitelist' or a 'blacklist'. An AP profile can only have one MAC filter assigned to it.

Use the **no** variant of this command to remove a MAC filter from an AP profile.

**Syntax** `wireless-mac-filter {permit|deny} <mac-filter-id>`  
`no wireless-mac-filter`

Parameter	Description
permit	Set the MAC filter as a whitelist.
deny	Set the MAC filter as a blacklist.
<mac-filter-id>	<1-65535> Enter the ID of the MAC filter to assign to the AP profile.

**Default** No MAC filter assigned by default.

**Mode** Wireless AP Profile Configuration

**Example** To assign the MAC filter '20' as a whitelist to wireless AP profile '1', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# wireless-mac-filter permit 20
```

To remove a MAC filter from wireless AP profile '1', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# no wireless-mac-filter
```

**Related commands** [description \(wireless-mac-flt\)](#)

[wireless import](#)

[wireless-mac-filter \(wireless\)](#)

wireless-mac-filter enable

**Command changes** Version 5.4.8-2.1: command added

# wireless-mac-filter enable

**Overview** Use this command to enable the MAC filter on a Virtual Access Point (VAP). It will enable the MAC filter based on the filter entry set in the AP profile.

Use the **no** variant of this command to disable the AMC filter on a VAP.

**Syntax** `wireless-mac-filter enable`  
`no wireless-mac-filter enable`

**Default** Disabled by default.

**Mode** Wireless Network Configuration

**Example** To enable wireless MAC filter on APs that use network 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# wireless-mac-filter enable
```

To disable wireless MAC filter on APs that use network 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# no wireless-mac-filter enable
```

**Command changes** Version 5.4.8-2.1: command added

# wireless wireless-trigger

**Overview** Use this command to activate or deactivate a wireless-trigger. You can set an action for a specific trigger ID, range of IDs, or all wireless-trigger IDs.

**Syntax** `wireless wireless-trigger [all|<trigger-id>] activate`  
`wireless wireless-trigger [all|<trigger-id>] deactivate`

Parameter	Description
all	Action all wireless-triggers.
<trigger-id>	The trigger ID. This can be a number in the range of 1-8. You can also specify multiple trigger IDs using a comma separated list.
activate	Activate wireless-trigger.
deactivate	Deactivate wireless-trigger.

**Default** Not set.

**Mode** Privileged Exec

**Example** To activate wireless-trigger 1, use the command:

```
awplus# wireless wireless-trigger 1 activate
```

To deactivate all wireless-triggers, use the command:

```
awplus# wireless wireless-trigger all deactivate
```

**Related commands** [show wireless wireless-trigger](#)  
[wireless-trigger](#)  
[description \(wireless-trigger\)](#)  
[show wireless network](#)

**Command changes** Version 5.5.1-0.1: command added

# wireless-trigger

**Overview** Use this command to add a wireless trigger and enter the wireless-trigger configuration mode.

Use the **no** variant of this command to delete a specific wireless-trigger ID configuration.

**Syntax** `wireless-trigger <trigger-id>`  
`no wireless-trigger <trigger-id>`

Parameter	Description
<code>&lt;trigger-id&gt;</code>	Enter an ID number in the range 1-8.

**Default** Not set

**Mode** Wireless Configuration

**Example** To add a wireless trigger and enter the wireless-trigger configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-trigger 1
awplus(config-wireless-trigger)#
```

To delete a wireless trigger, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wireless-trigger 1
```

**Command changes** Version 5.5.1-0.1: command added

# wireless-trigger-id

**Overview** Use this command to mark a network for a wireless-trigger.  
Use the **no** variant of this command to unmark a wireless trigger on a network.

**Syntax** `wireless-trigger-id <trigger-id>`  
`no wireless-trigger-id <trigger-id>`

Parameter	Description
<code>&lt;trigger-id&gt;</code>	Trigger ID, a numerical value in the range 1-8. The trigger must already exist.

**Default** Not set.

**Mode** Wireless Network Configuration

**Example** To mark a wireless trigger in network 5, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 5
awplus(config-wireless-network)# wireless-trigger-id 1
```

# Device Discovery using SNMP Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Device Discovery using SNMP.

SNMP Device Discovery is available from the AlliedWare Plus CLI and is also available from Vista Manager mini. This feature provides information that allows the CLI to display third party vendor device data in real time.

For more information, see the [Device Discovery and Monitoring using SNMP Feature Overview and Configuration Guide](#).

- Command List**
- [“clear snmp-discovery”](#) on page 3601
  - [“service snmp-discovery”](#) on page 3602
  - [“show running-config snmp-discovery”](#) on page 3603
  - [“show snmp-discovery”](#) on page 3604
  - [“snmp-discovery arp-polling-interval”](#) on page 3607
  - [“snmp-discovery community”](#) on page 3608
  - [“snmp-discovery deny”](#) on page 3609
  - [“snmp-discovery permit”](#) on page 3611
  - [“snmp-discovery snmp-polling-interval”](#) on page 3612
  - [“snmp-discovery snmp-version”](#) on page 3613
  - [“snmp-discovery user”](#) on page 3614

# clear snmp-discovery

**Overview** Use this command to remove information learned by the SNMP Discovery process.

**Syntax** `clear snmp-discovery ip [<ipv4-address>]`  
`clear snmp-discovery nodes [<ipv4-address>]`

Parameter	Description
ip	Internet Protocol (IP)
<ipv4-address>	IPv4 network address for the discovered device, for example 192.168.3.1
nodes	Node information
<ipv4-address>	IPv4 network address for the discovered nodes, for example 192.168.3.1

**Default** No information is cleared.

**Mode** Privileged Exec

**Examples** To remove all SNMP discovered devices, use the command:

```
node1# clear snmp-discovery nodes
```

To remove a particular SNMP discovered device, use the command:

```
node1# clear snmp-discovery nodes 192.168.3.1
```

To remove all entries from SNMP Discovery's database of devices discovered by ARP, use the command:

```
node1# clear snmp-discovery ip
```

To remove a particular entry from SNMP Discovery's database of devices discovered by ARP, use the command:

```
node1# clear snmp-discovery ip 192.168.3.1
```

**Related commands** [show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# service snmp-discovery

**Overview** Use this command to enable SNMP Discovery to discover devices on an AMF network.

Use the **no** variant of this command to disable SNMP Discovery.

**Syntax** `service snmp-discovery`  
`no service snmp-discovery`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** The server starts a process which detects IP addresses reachable on a network. An SNMP 'get' request is performed on these IP addresses to detect device information. The SNMP name, SNMP description, SNMP location, and SNMP serial number are obtained if they are available.

SNMP Discovery will not run if there are no Layer 3 IP interfaces configured.

**Example** To start the discovery service on the AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# service snmp-discovery
```

**Related commands** [show snmp-discovery](#)  
[snmp-discovery arp-polling-interval](#)  
[snmp-discovery community](#)  
[snmp-discovery deny](#)  
[snmp-discovery permit](#)  
[snmp-discovery snmp-polling-interval](#)  
[snmp-discovery user](#)  
[snmp-discovery snmp-version](#)

**Command changes** Version 5.5.0-0.3: command added

# show running-config snmp-discovery

**Overview** Use this command to display the running configuration for SNMP Discovery.

**Syntax** `show running-config snmp-discovery`

**Mode** Privileged Exec

**Example** To display the running configuration for SNMP Discovery, use the command:

```
awplus# show running-config snmp-discovery
```

**Output** Figure 64-1: Example output from **show running-config snmp-discovery**

```
node1#show running-config snmp-discovery
service snmp-discovery
snmp-discovery community accounting
snmp-discovery user tim encrypted auth md5
U2FsdGVkX1/LyNttTLDzgJTG6Eh5g2L4ahgXuHLENA= priv des
U2FsdGVkX1+FJsefN+ZvSzUUviRt9ZdsFwtB6HU121U=
snmp-discovery permit ip 192.168.3.2
snmp-discovery permit ip 192.168.3.6
snmp-discovery deny ip 192.168.3.5
```

**Related commands** [show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# show snmp-discovery

**Overview** Use this command to show information about the SNMP Discovery process.

**Syntax** `show snmp-discovery [detail|ip|nodes]`

Parameter	Description
detail	SNMP Discovery node detail
ip	SNMP Discovery IP addresses
nodes	SNMP Discovery node information

**Mode** User Exec

**Examples** To display information about the SNMP Discovery status, use the command:

```
awplus# show snmp-discovery
```

To display information about the SNMP Discovery IPv4 addresses learned, use the command:

```
awplus# show snmp-discovery ip
```

To display information about the SNMP Discovery nodes learned, use the command:

```
awplus# show snmp-discovery nodes
```

To display information about the SNMP Discovery in greater detail, use the command:

```
awplus# show snmp-discovery detail
```

**Output** Figure 64-2: Example output from **show snmp-discovery**

```
awplus#show snmp-discovery
SNMP Discovery information:
SNMP Discovery : Enabled
SNMP Polling interval : 300
ARP Polling interval : 60
SNMP Discovery version : v2c
SNMPv2 Discovery Community : accounting
```

Figure 64-3: Example output from **show snmp-discovery ip**

```

- Related commands**
- [clear snmp-discovery](#)
  - [service snmp-discovery](#)
  - [show running-config snmp-discovery](#)
  - [snmp-discovery arp-polling-interval](#)
  - [snmp-discovery deny](#)
  - [snmp-discovery permit](#)
  - [snmp-discovery snmp-polling-interval](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery arp-polling-interval

**Overview** Use this command to configure the SNMP ARP polling interval.

Use the **no** variant of this command to set the SNMP ARP polling interval back to the default (60 seconds).

**Syntax** `snmp-discovery arp-polling-interval <1-3600>`  
`no snmp-discovery arp-polling-interval`

Parameter	Description
<1-3600>	The polling number in seconds to interval in the range from 1 to 3600.

**Default** ARP requests are sent out every 60 seconds

**Mode** Global Configuration

**Usage notes** SNMP Discovery first uses ARP to discover subnets that are reachable from the AMF node. This polling happens every 60 seconds by default. Use this command to change the polling interval.

**Examples** To configure the SNMP Discovery ARP polling interval to 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery arp-polling-interval 120
```

To set the SNMP Discovery ARP polling interval back to the default (60 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery arp-polling-interval
```

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery community

**Overview** Use this command to create an SNMP community in read-only mode for SNMPv1 and v2c only.

Use the **no** variant of this command to remove an SNMP community.

**Syntax** `snmp-discovery community <community-name>`

Parameter	Description
<code>&lt;community-name&gt;</code>	The name of the community that can be up to 20 characters long and is case sensitive.

**Default** The SNMP Discovery community name is 'public' by default

**Mode** Global Configuration

**Usage notes** This command creates an SNMP community in read-only mode. The community allows access to all MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used for SNMPv3.

**Examples** To configure an SNMP community named 'accounting', use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery community accounting
```

To set the SNMP community name back to the default (public), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery community
```

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery deny

**Overview** Use this command to prevent ARP requests from being sent. When an interface or IPv4 address is denied, it means an ARP request and SNMP 'get' request will never be sent to that device when the command **service snmp-discovery** is enabled.

Use the **no** variant of this command to remove the configuration.

**Syntax**

```
snmp-discovery deny interface <interface-range>
snmp-discovery deny ip <ipv4-address>
no snmp-discovery deny interface <interface-range>
no snmp-discovery deny ip <ipv4-address>
```

Parameter	Description
interface	Interfaces to deny
<interface-name>	Interface name, for example VLAN2
ip	IP address
<ipv4-address>	IPv4 address to deny

**Default** AMF and stacking management VLANs are denied

**Mode** Global Configuration

**Examples** To configure a deny interface command for VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery deny interface vlan2
```

To stop interface VLAN2 from being denied, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery deny interface vlan2
```

To configure a deny IP command for IP address 192.168.3.2, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery deny ip 192.168.3.2
```

To stop IP address 192.168.3.2 from being denied, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery deny ip 192.168.3.2
```

**Output** Figure 64-6: Example output from **show snmp-discovery ip**

```
awplus#show snmp-discovery ip
SNMP Discovery Devices:
```

IP Address	MAC Address	Type	State	Last Seen Time
192.168.3.2	-	Deny	-	-
1.2.3.6	-	Permit	-	30 Jul, 2020 06:30:55
1.2.3.4	-	Permit	-	31 Jul, 2020 05:49:04
192.168.2.2	3863.bb5c.b900	Dynamic	Up	-

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery permit

**Overview** Use this command if you want to allow SNMP Discovery to do requests on interfaces with greater than 256 members. You can permit a specific IP address.

**Syntax** `snmp-discovery permit ip <ipv4-address>`  
`no snmp-discovery permit ip <ipv4-address>`

Parameter	Description
ip	Internet Protocol (IP)
<ipv4-address>	IPv4 network address

**Default** All IPv4 interfaces with 256 members or less are included in SNMP Discovery.

**Mode** Global Configuration

**Examples** To configure a permit IP command for the address 192.168.3.2, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery permit ip 192.168.3.2
```

To remove the permit configuration for the address 192.168.3.2, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery permit ip 192.168.3.2
```

**Output** Figure 64-7: Example output from **show snmp-discovery ip**

```
awplus#show snmp-discovery ip
SNMP Discovery Devices:
```

IP Address	MAC Address	Type	State	Last Seen Time
1.2.3.5	-	Deny	-	-
1.2.3.6	-	Permit	-	Jul 27, 2020 03:33:39
1.2.3.4	-	Permit	-	Jul 28, 2020 04:25:05
192.168.2.2	3863.bb5c.b900	Dynamic	Up	-
192.168.3.2	4263.cc3c.b500	permit	Up	-

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery snmp-polling-interval

**Overview** Use this command to change the SNMP request polling interval (in seconds).  
Use the **no** variant of this command to set the SNMP request polling interval back to the default (300 seconds).

**Syntax** `snmp-discovery snmp-polling-interval <60-3600>`  
`no snmp-discovery snmp-polling-interval`

Parameter	Description
<code>&lt;60-3600&gt;</code>	The number of seconds for the SNMP polling interval. From the range 60 to 3600.

**Default** 300 seconds (5 minutes)

**Mode** Global Configuration

**Usage notes** ARP polling and SNMP Discovery uses SNMP 'get' requests to poll the devices discovered by the ARP polling. This polling happens every 300 seconds (5 minutes) by default.

SNMP polling is enabled when **service snmp-discovery** is enabled.

**Examples** To configure the SNMP discovery polling interval to 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery snmp-polling-interval 120
```

To set the SNMP discovery polling interval back to the default (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery snmp-polling-interval
```

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery snmp-version

**Overview** Use this command to set the SNMP version that you are using.  
Use the **no** variant of this command to set the SNMP version back to the default (v2c).

**Syntax** `snmp-discovery snmp-version {v1|v2c|v3}`  
`no snmp-discovery snmp-version`

Parameter	Description
v1	Enter the SNMP version number you are using
v2c	If you are using SNMP version v2c, set the community name with the command <b>snmp-discovery community</b>
v3	If you are using SNMP version v3, set the security with the command <b>snmp-discovery user</b>

**Default** SNMP version v2c

**Mode** Global Configuration

**Usage notes** This command defaults to SNMP version v2c and creates an SNMP community in read-only mode. The community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

If using SNMPv3, you can choose the security level and then the authentication protocol and privacy protocol.

**Examples** To configure SNMP Discovery to use SNMP version 3, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery snmp-version v3
```

To set the SNMP Discovery SNMP version back to the default (v2c), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery snmp-version
```

**Related commands** [service snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery user

**Overview** Use this command to create a user for SNMPv3 'get' requests only.

Use the **no** variant of this command to remove an SNMPv3 user.

**Syntax** `snmp-discovery user <user-name> [encrypted] [auth {md5|sha} <auth-password>] [priv {des|aes} <privacy-password>]`  
`no snmp-discovery user <user-name>`

Parameter	Description
<user-name>	The user name is a string up to 20 characters long and is case sensitive. For example, 'Rodger'.
encrypted	Use the encrypted parameter when you want to enter encrypted passwords.
auth	Authentication protocol that can be either MD5 or SHA.
md5	MD5 Message Digest Algorithms.
sha	SHA Secure Hash Algorithm.
<auth-password>	Authentication password that is a string from 8 to 20 characters and is case sensitive.
priv	Privacy protocol that can be either DES or AES.
des	DES Data Encryption Standard.
aes	AES Advanced Encryption Standards.
<privacy-password>	Privacy password is a string from 8 to 20 characters and is case sensitive.

**Default** No user is configured

**Mode** Global Configuration

**Usage notes** Additionally, this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

The authentication method must match what is used on the devices being configured.

Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configurations stored on the switch.

User passwords are entered using plain text without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.

User passwords are viewed as encrypted passwords in running and startup configurations shown from the **show running-config** and **show startup-config**

commands. Copy and paste encrypted passwords from the running configuration or startup configuration to avoid entry errors.

**Examples** To add SNMP Discovery user 'authuser' with authentication protocol 'md5', authentication password 'authpass' privacy protocol 'des' and privacy password privpass, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery user authuser auth md5 Authpass
priv des Privpass
```

To enter existing SNMP user 'authuser' with existing passwords with authentication protocol 'md5' plus the encrypted authentication password '0x1c74b9c22118291b0ce0cd883f8dab6b74', privacy protocol 'des' plus the encrypted privacy password '0x0e0133db5453ebd03822b004eeacb6608f', use the following commands:

*Note Copy and paste the encrypted passwords from the running-config or the startup-config displayed, using the show running-config and show startup-config commands respectively, into the command line to avoid key stroke errors issuing this command.*

```
awplus# configure terminal
awplus(config)# snmp-discovery user authuser encrypted auth
md50x1c74b9c22118291b0ce0cd883f8dab6b74 priv des
0x0e0133db5453ebd03822b004eeacb6608f
```

To delete SNMP user 'authuser', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery user authuser
```

**Output** Figure 64-8: Example output from **show snmp-discovery**

```
awplus#show snmp-discovery
SNMP Discovery information:

SNMP Discovery : Enabled
SNMP Polling interval : 300
ARP Polling interval : 60

# Dynamic Host Configuration Protocol (DHCP) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure DHCP.

For more information, see the [DHCP Feature Overview and Configuration Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

- Command List**
- [“bootfile”](#) on page 3618

- ["vrf"](#) on page 3688

# bootfile

**Overview** This command sets the boot filename for a DHCP server pool. This is the name of the boot file that the client should use in its bootstrap process. It may need to include a path.

The **no** variant of this command removes the boot filename from a DHCP server pool.

**Syntax** `bootfile <filename>`  
`no bootfile`

Parameter	Description
<code>&lt;filename&gt;</code>	The boot file name.

**Mode** DHCP Configuration

**Example** To configure the boot filename for a pool P2, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# bootfile boot/main_boot.bt
```

# clear ip dhcp binding

**Overview** This command clears either a specific lease binding or the lease bindings specified by the command or DHCP server. The command will only take effect on dynamically allocated bindings, not statically configured bindings.

**Syntax** `clear ip dhcp binding {ip <ip-address>|mac <mac-address>|all|pool <pool-name>|range <low-ip-address> <high-ip-address>}`

**Syntax (VRF-lite)** `clear ip dhcp binding [vrf <name>|global] {ip <ip-address>|mac <mac-address>|all|pool <pool-name>|range <low-ip-address> <high-ip-address>}`

Parameter	Description
vrf	Display the output for a VRF instance
<name>	The name of the specific VRF instance.
global	Display the output for the Global VRF instance
ip <ip-address>	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D.
mac <mac-address>	MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH.
all	All DHCP bindings.
pool <pool-name>	Description used to identify DHCP server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks".
range <low-ip-address> <high-ip-address>	IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end of the range.

**Mode** User Exec and Privileged Exec

**Usage** A specific binding may be deleted by **ip** address or **mac** address, or several bindings may be deleted at once using **all**, **pool** or **range**.

Note that if you specify to clear the **ip** or **mac** address of what is actually a static DHCP binding, an error message is displayed. If **all**, **pool** or **range** are specified and one or more static DHCP bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

**Examples** To clear the specific IP address binding 192.168.1.1, use the command:

```
awplus# clear ip dhcp binding ip 192.168.1.1
```

To clear all dynamic DHCP entries, use the command:

```
awplus# clear ip dhcp binding all
```

**Example (VRF-lite)** To clear all dynamic binding from VRF red instance, use the command:

```
awplus# clear ip dhcp binding vrf red all
```

**Related commands** [show ip dhcp binding](#)

# default-router

**Overview** This command adds a default router to the DHCP address pool you are configuring. You can use this command multiple times to create a list of default routers on the client's subnet. This sets the router details using the pre-defined option 3. Note that if you add a user-defined option 3 using the **option** command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified default router, or all default routers from the DHCP pool.

**Syntax** `default-router <ip-address>`  
`no default-router [<ip-address>]`

Parameter	Description
<code>&lt;ip-address&gt;</code>	IPv4 address of the default router, in dotted decimal notation.

**Mode** DHCP Configuration

**Examples** To add a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# default-router 192.168.1.2
```

To remove a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router 192.168.1.2
```

To remove all routers from the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router
```

# dns-server

**Overview** This command adds a Domain Name System (DNS) server to the DHCP address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6.

Note that if you add a user-defined option 6 using the [option](#) command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified DNS server, or all DNS servers from the DHCP pool.

**Syntax** `dns-server <ip-address>`  
`no dns-server [<ip-address>]`

Parameter	Description
<code>&lt;ip-address&gt;</code>	IPv4 address of the DNS server, in dotted decimal notation.

**Mode** DHCP Configuration

**Examples** To add the DNS server with the assigned IP address 192.168.1.1 to the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# dns-server 192.168.1.1
```

To remove the DNS server with the assigned IP address 192.168.1.1 from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server 192.168.1.1
```

To remove all DNS servers from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server
```

**Related commands**

- [default-router](#)
- [option](#)
- [service dhcp-server](#)
- [show ip dhcp pool](#)
- [subnet-mask](#)

# domain-name

**Overview** This command adds a domain name to the DHCP address pool you are configuring. Use this command to specify the domain name that a client should use when resolving host names using the Domain Name System. This sets the domain name details using the pre-defined option 15.

Note that if you add a user-defined option 15 using the [option](#) command, then you will override any settings created with this command.

The **no** variant of this command removes the domain name from the address pool.

**Syntax** `domain-name <domain-name>`  
`no domain-name`

Parameter	Description
<code>&lt;domain-name&gt;</code>	The domain name you wish to assign the DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

**Mode** DHCP Configuration

**Examples** To add the domain name `Nerv_Office` to DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# domain-name Nerv_Office
```

To remove the domain name `Nerv_Office` from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no domain-name Nerv_Office
```

**Related commands**

- [default-router](#)
- [dns-server](#)
- [option](#)
- [service dhcp-server](#)
- [show ip dhcp pool](#)
- [subnet-mask](#)

# host (DHCP)

**Overview** This command adds a static host address to the DHCP address pool you are configuring. The client with the matching MAC address is permanently assigned this IP address. No other clients can request it.

The **no** variant of this command removes the specified host address from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

**Syntax** `host <ip-address> <mac-address>`  
`no host <ip-address>`  
`no host all`

Parameter	Description
<code>&lt;ip-address&gt;</code>	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D
<code>&lt;mac-address&gt;</code>	MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH

**Mode** DHCP Configuration

**Usage** Note that a network/mask must be configured using a **network** command before issuing a **host** command. Also note that a host address must match a network to add a static host address.

**Examples** To add the host at 192.168.1.5 with the MAC address 000a.451d.6e34 to DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# network 192.168.1.0/24
awplus(dhcp-config)# host 192.168.1.5 000a.451d.6e34
```

To remove the host at 192.168.1.5 with the MAC address 000a.451d.6e34 from DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# no host 192.168.1.5 000a.451d.6e34
```

**Related  
Commands** [lease](#)  
[range](#)

[show ip dhcp pool](#)

# ip address dhcp

**Overview** This command activates the DHCP client on the interface you are configuring. This allows the interface to use the DHCP client to obtain its IP configuration details from a DHCP server on its connected network.

The **client-id** and **hostname** parameters are identifiers that you may want to set in order to interoperate with your existing DHCP infrastructure. If neither option is needed, then the DHCP server uses the MAC address field of the request to identify the host.

The DHCP client supports the following IP configuration options:

- Option 1— the subnet mask for your device.
- Option 3— a list of default routers.
- Option 6 — a list of DNS servers. This list appends the DNS servers set on your device with the [ip name-server](#) command.
- Option 15—a domain name used to resolve host names. This option replaces the domain name set with the [ip domain-name](#) command. Your device ignores this domain name if it has a domain list set using the [ip domain-list](#) command.
- Option 51—lease expiration time.

The **no** variant of this command stops the interface from obtaining IP configuration details from a DHCP server.

**Syntax** `ip address dhcp [client-id <interface>] [hostname <hostname>]`  
`no ip address dhcp`

Parameter	Description
<code>client-id</code> <code>&lt;interface&gt;</code>	The name of the interface you are activating the DHCP client on. If you specify this, then the MAC address associated with the specified interface is sent to the DHCP server in the optional identifier field. Default: no default
<code>hostname</code> <code>&lt;hostname&gt;</code>	The hostname for the DHCP client on this interface. Typically this name is provided by the ISP. Default: no default

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the interface `vlan2` to use DHCP to obtain an IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address dhcp
```

To stop the interface vlan2 from using DHCP to obtain its IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip address dhcp
```

**Related commands**

- [ip address \(IP Addressing and Protocol\)](#)
- [show ip interface](#)
- [show running-config](#)

# ip dhcp bootp ignore

**Overview** This command configures the DHCP server to ignore any BOOTP requests it receives. The DHCP server accepts BOOTP requests by default.

The **no** variant of this command configures the DHCP server to accept BOOTP requests. This is the default setting.

**Syntax** `ip dhcp bootp ignore`  
`no ip dhcp bootp ignore`

**Mode** Global Configuration

**Examples** To configure the DHCP server to ignore BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp bootp ignore
```

To configure the DHCP server to respond to BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp bootp ignore
```

**Related commands** [show ip dhcp server summary](#)

# ip dhcp leasequery enable

**Overview** Use this command to enable the DHCP server to respond to DHCPLEASEQUERY packets. Enabling the DHCP leasequery feature allows a DHCP Relay Agent to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

Use the **no** variant of this command to disable the support of DHCPLEASEQUERY packets.

For more information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** ip dhcp leasequery enable  
no ip dhcp leasequery enable

**Default** DHCP leasequery support is disabled by default.

**Mode** Global Configuration

**Examples** To enable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp leasequery enable
```

To disable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp leasequery enable
```

**Related commands** [show counter dhcp-server](#)  
[show ip dhcp server statistics](#)  
[show ip dhcp server summary](#)

# ip dhcp option

**Overview** This command creates a user-defined DHCP option. Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

You can use this option when configuring a DHCP pool, by using the [option](#) command.

The **no** variant of this command removes either the specified user-defined option, or removes all user-defined options. This also automatically removes the user-defined options from the associated DHCP address pools.

**Syntax** `ip dhcp option <1-254> [name <option-name>] [<option-type>]`  
`no ip dhcp option [<1-254>|<option-name>]`

Parameter	Description										
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.										
<option-name>	Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". Default: no default										
<option-type>	The option value. You must specify a value that is appropriate to the option type: <table border="1"><tbody><tr><td>ascii</td><td>An ASCII text string</td></tr><tr><td>hex</td><td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td></tr><tr><td>ip</td><td>An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.</td></tr><tr><td>integer</td><td>A number from 0 to 4294967295.</td></tr><tr><td>flag</td><td>A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b>, <b>on</b>, or <b>enabled</b> will set the flag. <b>false</b>, <b>off</b> or <b>disabled</b> will unset the flag.</td></tr></tbody></table>	ascii	An ASCII text string	hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.	ip	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.	integer	A number from 0 to 4294967295.	flag	A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.
ascii	An ASCII text string										
hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.										
ip	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.										
integer	A number from 0 to 4294967295.										
flag	A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.										

**Mode** Global Configuration

**Examples** To define a user-defined ASCII string option as option 66, without a name, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name `tcpip-node-type`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name `special-address`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option 12
```

To remove the specific user-defined option with the option name `perform-router-discovery`, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option perform-router-discovery
```

To remove all user-defined option definitions, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option
```

**Related  
commands**

[default-router](#)  
[dns-server](#)  
[domain-name](#)  
[option](#)  
[service dhcp-server](#)  
[show ip dhcp server summary](#)  
[subnet-mask](#)

# ip dhcp pool

**Overview** This command will enter the configuration mode for the pool name specified. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCP configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCP pools on devices with multiple interfaces. This allows the device to act as a DHCP server on multiple interfaces to distribute different information to clients on the different networks.

The **no** variant of this command deletes the specific DHCP pool.

**Syntax** `ip dhcp pool <pool-name>`  
`no ip dhcp pool <pool-name>`

Parameter	Description
<code>&lt;pool-name&gt;</code>	Description used to identify this DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

**Mode** Global Configuration

**Example** To create the DHCP pool named P2 and enter DHCP Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)#
```

To delete the DHCP pool named P2, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp pool P2
```

**Related commands** [service dhcp-server](#)

# ip dhcp-client default-route distance

**Overview** Use this command to specify an alternative Administrative Distance (AD) for the current default route (from DHCP) for an interface.

Use the **no** variant of this command to set the AD back to the default of 1.

**Syntax** `ip dhcp-client default-route distance [<1-255>]`  
`no ip dhcp-client default-route distance`

Parameter	Description
<1-255>	Administrative Distance (AD) from the range 1 though 255.

**Default** 1

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** DHCP client interfaces can automatically add a default route with an AD of 1 into the IP Routing Information Base (RIB).

Any pre-existing default route(s) via alternative interfaces (configured with a higher AD) will no longer be selected as the preferred forwarding path for traffic when the DHCP based default route is added to the IP routing table.

This can be problematic if the DHCP client is operating via an interface that is only intended to be used for back-up interface redundancy purposes, such as an interface with lower bandwidth or a particular role like the management interface.

Use this command to set the AD of the default route (via a specific DHCP client interface) to a non-default (higher cost) value, ensuring any pre-existing default route(s) via any other interface(s) continue to be selected as the preferred forwarding path for network traffic.

When the command is used, the static default route is deleted from the RIB, the distance value of the route is modified to the configured distance value, then it is reinstalled into the RIB.

**Examples** To configure vlan10 as a DHCP client and to set the AD for the default route added by DHCP to 150, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# ip address dhcp
awplus(config-if)# ip dhcp-client default-route distance 150
```

To set the AD for the default route back to the default value of 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-client default-route distance
```

**Related  
commands**

[show ip route](#)  
[show ip route database](#)

**Command  
changes**

Version 5.4.7-0.2 Command added.

# ip dhcp-client request vendor-identifying-specific

**Overview** Use this command to add vendor-identifying vendor-specific information (option 125) requests to the DHCP discovery packets sent by an interface. This option, along with option 124, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-specific request from an interface.

**Syntax** `ip dhcp-client request vendor-identifying-specific`  
`no ip dhcp-client request vendor-identifying-specific`

**Default** The vendor-identifying-specific request is not configured by default.

**Mode** Interface Configuration

**Usage notes** The DHCP client must be activated on the interface, using the [ip address dhcp](#) command, so that DHCP discovery packets are sent.

**Example** To add the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-client request
vendor-identifying-specific
```

To remove the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client request
vendor-identifying-specific
```

**Related commands** [ip address dhcp](#)  
[ip dhcp-client vendor-identifying-class](#)

**Command changes** Version 5.4.7-2.1: command added

# ip dhcp-client vendor-identifying-class

**Overview** Use this command to add a vendor-identifying vendor class (option 124) to the DHCP discovery packets sent by an interface. This option places the Allied Telesis Enterprise number (207) into the discovery packet. Option 124, along with option 125, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-class from an interface.

**Syntax** `ip dhcp-client vendor-identifying-class`  
`no ip dhcp-client vendor-identifying-class`

**Default** The vendor-identifying-class is not configured by default.

**Mode** Interface Configuration

**Usage notes** The DHCP client must be activated on the interface, using the [ip address dhcp](#) command, so that DHCP discovery packets are sent.

**Example** To remove the vendor-identifying-class on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client vendor-identifying-class
```

**Related commands** [ip address dhcp](#)  
[ip dhcp-client request vendor-identifying-specific](#)

**Command changes** Version 5.4.7-2.1: command added

# ip dhcp-relay agent-option

**Overview** This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands `ip dhcp-relay agent-option` and `ip dhcp-relay information policy` have been configured.*

**Syntax**

```
ip dhcp-relay agent-option
no ip dhcp-relay agent-option
```

**Default** DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the [ip dhcp-relay max-message-length](#) command.

This command cannot be enabled if DHCP snooping is enabled on your device ([service dhcp-snooping](#) command), and vice versa.

**Examples** To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

**Related commands**

- `ip dhcp-relay agent-option remote-id`
- `ip dhcp-relay information policy`
- `ip dhcp-relay max-message-length`
- `service dhcp-relay`

# ip dhcp-relay agent-option checking

**Overview** This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that [ip dhcp-relay agent-option](#) must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option checking`  
`no ip dhcp-relay agent-option checking`

**Mode** Interface Configuration for a VLAN interface.

**Examples** To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

**Related commands** [ip dhcp-relay agent-option](#)  
[ip dhcp-relay agent-option remote-id](#)  
[ip dhcp-relay information policy](#)  
[service dhcp-relay](#)

# ip dhcp-relay agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option remote-id <remote-id>`  
`no ip dhcp-relay agent-option remote-id`

Parameter	Description
<code>&lt;remote-id&gt;</code>	An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed.

**Default** The Remote ID is set to the device's MAC address by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

**Examples** To set the Remote ID to myid for client DHCP packets received on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

**Related commands** [ip dhcp-relay agent-option](#)  
[ip dhcp-relay agent-option checking](#)  
[show ip dhcp-relay](#)

# ip dhcp-relay information policy

**Overview** This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.

**Syntax**

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

Parameter	Description
append	The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.
drop	The DHCP Relay Agent discards the packet.
keep	The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.
replace	The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet.

**Mode** Interface Configuration for a VLAN interface.

**Examples** To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [service dhcp-server](#)

# ip dhcp-relay maxhops

**Overview** This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay maxhops <1-255>`  
`no ip dhcp-relay maxhops`

Parameter	Description
<1-255>	The maximum hop count value.

**Default** The default hop count threshold is 10 hops.

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay max-message-length

**Overview** This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay max-message-length <548-1472>`  
`no ip dhcp-relay max-message-length`

Parameter	Description
<548-1472>	The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes).

**Default** The default is 1400 bytes.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

**NOTE:** Before setting this command, you must first run the `ip dhcp-relay agent-option` command. This will allow the DHCP Relay Agent Option 82 fields to be appended.

**Example** To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface `vlan2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay server-address

**Overview** This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax**

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay
```

Parameter	Description
<ipv4-address>	Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D.
<ipv6-address>	Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.
<server-interface>	Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the [service dhcp-relay](#) command to enable the DHCP Relay Agent on your device. The [ip dhcp-relay server-address](#) command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

**Examples** To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay use-client-side-address

**Overview** Use this command to configure DHCP-Relay to use the client-side interface (that is the interface receiving the DHCP client packets) IP address as the source address of the relayed DHCP packets.

Use the **no** variant of this command to disable the use of the client-side interface IP address as the source IP address for relayed DHCP packets.

**Syntax** `ip dhcp-relay use-client-side-address`  
`no ip dhcp-relay use-client-side-address`

Parameter	Description
<code>use-client-side-address</code>	Use the client side interface IP address as the source IP address for relayed DHCP packets.

**Default** By default, the server-side interface IP address is used as the source IP address of DHCP relayed packets.

**Mode** Global Configuration

**Usage notes** In most cases, there are filters placed between the DHCP relay and DHCP server which only allow DHCP packets from the client subnet to the server and back. This command allows you to configure the DHCP relay so that the relay will use the IP address of the interface **receiving** clients DHCP requests to be used as the source IP address of the relayed DHCP packets.

**Example** To configure the client-side IP address as the source IP address of DHCP relayed packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp-relay use-client-side-address
```

**Output** Figure 65-1: Example output from **show ip dhcp-relay**

Note that the second line of the display output shows the status of the client-side address being enabled as the source IP address.

```
awplus#sh ip dhcp-relay

DHCP Relay Service is enabled
Use of client side address as source address is enabled

vlan2 is down, line protocol is down
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
Insertion of Subscriber-ID auto-MAC is disabled
The Remote Id string for Relay Agent Option is 0000.0000.0000
Relay Information policy is to replace existing relay agent information
List of servers : 10.1.1.100
```

**Related commands** [ip dhcp-relay server-address](#)

**Command changes** Version 5.4.9-0.7: command added

# lease

**Overview** This command sets the expiration time for a leased address for the DHCP address pool you are configuring. The time set by the days, hours, minutes and seconds is cumulative. The minimum total lease time that can be configured is 20 seconds. The maximum total lease time that can be configured is 120 days.

Note that if you add a user-defined option 51 using the `option` command, then you will override any settings created with this command. Option 51 specifies a lease time of 1 day.

Use the **infinite** parameter to set the lease expiry time to infinite (leases never expire).

Use the **no** variant of this command to return the lease expiration time back to the default of one day.

**Syntax** `lease <days> <hours> <minutes> [<seconds>]`  
`lease infinite`  
`no lease`

Parameter	Description
<code>&lt;days&gt;</code>	The number of days, from 0 to 120, that the lease expiry time is configured for. Default: 1
<code>&lt;hours&gt;</code>	The number of hours, from 0 to 24, that the lease expiry time is configured for. Default: 0
<code>&lt;minutes&gt;</code>	The number of minutes, from 0 to 60, the lease expiry time is configured for. Default: 0
<code>&lt;seconds&gt;</code>	The number of seconds, from 0 to 60, the lease expiry time is configured for.
<code>infinite</code>	The lease never expires.

**Default** The default lease time is 1 day.

**Mode** DHCP Configuration

**Examples** To set the lease expiration time for address pool P2 to 35 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# lease 0 0 35
```

To set the lease expiration time for the address pool `Nerv_Office` to 1 day, 5 hours, and 30 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# lease 1 5 30
```

To set the lease expiration time for the address pool `P3` to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P3
awplus(dhcp-config)# lease 0 0 0 20
```

To set the lease expiration time for the pool to never expire, use the command:

```
awplus(dhcp-config)# lease infinite
```

To return the lease expiration time to the default of one day, use the command:

```
awplus(dhcp-config)# no lease
```

**Related  
commands**

[option](#)  
[service dhcp-server](#)  
[short-lease-threshold](#)

# network (DHCP)

**Overview** This command sets the network (subnet) that the DHCP address pool applies to. The **no** variant of this command removes the network (subnet) from the DHCP address pool.

**Syntax**

```
network
{<ip-subnet-address/prefix-length>|<ip-subnet-address/mask>}
no network
```

Parameter	Description
<i>&lt;ip-subnet-address/prefix-length&gt;</i>	The IPv4 subnet address in dotted decimal notation followed by the prefix length in slash notation.
<i>&lt;ip-subnet-address/mask&gt;</i>	The IPv4 subnet address in dotted decimal notation followed by the subnet mask in dotted decimal notation.

**Mode** DHCP Configuration

**Usage notes** This command will fail if it would make existing ranges invalid. For example, if they do not lie within the new network you are configuring.

The **no** variant of this command will fail if ranges still exist in the pool. You must remove all ranges in the pool before issuing a **no network** command to remove a network from the pool.

**Examples** To configure a network for the address pool P2, where the subnet is 192.0.2.5 and the mask is 255.255.255.0, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5/24
```

or you can use dotted decimal notation instead of slash notation for the subnet-mask:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5 255.255.255.0
```

**Related commands** [service dhcp-server](#)  
[subnet-mask](#)

## next-server

**Overview** This command sets the next server address for a DHCP server pool. It is the address of the next server that the client should use in its bootstrap process.

The **no** variant of this command removes the next server address from the DHCP address pool.

**Syntax** `next-server <ip-address>`  
`no next-server`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The server IP address, entered in dotted decimal notation.

**Mode** DHCP Configuration

**Example** To set the next-server address for the address pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# next-server 192.0.2.2
```

# option

**Overview** This command adds a user-defined option to the DHCP address pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value. Options with an **ip** type can hold a list of IP addresses or masks (i.e. entries that have the A.B.C.D address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IP addresses.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

The **no** variant of this command removes the specified user-defined option from the DHCP pool, or all user-defined options from the DHCP pool.

**Syntax** `option [<1-254>|<option-name>] <option-value>`  
`no option [<1-254>|<option-value>]`

Parameter	Description								
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.								
<option-name>	Option name associated with the option.								
<option-value>	The option value. You must specify a value that is appropriate to the option type: <table border="1" data-bbox="710 1261 1423 1751"> <tbody> <tr> <td>hex</td> <td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td> </tr> <tr> <td>ip</td> <td>An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.</td> </tr> <tr> <td>integer</td> <td>A number from 0 to 4294967295.</td> </tr> <tr> <td>flag</td> <td>A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.</td> </tr> </tbody> </table>	hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.	ip	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.	integer	A number from 0 to 4294967295.	flag	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.
hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.								
ip	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.								
integer	A number from 0 to 4294967295.								
flag	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.								

**Mode** DHCP Configuration

**Examples** To add the ASCII-type option named `tftp-server-name` to the pool P2 and give the option the value `server1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool P2 and give the option the value `08af`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option 175, use the command:

```
awplus(dhcp-config)# option 175 192.0.2.6
awplus(dhcp-config)# option 175 192.0.2.12
awplus(dhcp-config)# option 175 192.0.2.33
```

To add the option 179 to a pool, and give the option the value `123456`, use the command:

```
awplus(dhcp-config)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the command:

```
awplus(dhcp-config)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the command:

```
awplus(dhcp-config)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the command:

```
awplus(dhcp-config)# no option tftp-server-name
```

**Related  
commands**

[dns-server](#)

[ip dhcp option](#)

[lease](#)

[service dhcp-server](#)

[show ip dhcp pool](#)

# probe enable

**Overview** Use this command to enable lease probing for a DHCP pool. Probing is used by the DHCP server to check if an IP address it wants to lease to a client is already being used by another host.

The **no** variant of this command disables probing for a DHCP pool.

**Syntax** probe enable  
no probe enable

**Default** Probing is enabled by default.

**Mode** DHCP Pool Configuration

**Examples** To enable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe enable
```

To disable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe enable
```

**Related commands**

- [ip dhcp pool](#)

- [probe timeout](#)
- [probe type](#)
- [show ip dhcp pool](#)

# probe packets

**Overview** Use this command to specify the number of packets sent for each lease probe. Lease probing is configured on a per-DHCP pool basis. When set to 0 probing is effectively disabled.

The **no** variant of this command sets the number of probe packets sent to the default of 5.

**Syntax** `probe packets <0-10>`  
`no probe packets`

Parameter	Description
<0-10>	The number of probe packets sent.

**Default** The default is 5.

**Mode** DHCP Pool Configuration

**Examples** To set the number of probe packets to 2 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe packets 2
```

To set the number of probe packets to the default 5 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe packets
```

**Related commands** [probe enable](#)  
[probe timeout](#)  
[probe type](#)  
[show ip dhcp pool](#)

# probe timeout

**Overview** Use this command to set the timeout value in milliseconds that the server waits for a response after each probe packet is sent. Lease probing is configured on a per-DHCP pool basis.

The **no** variant of this command sets the probe timeout value to the default setting, 200 milliseconds.

**Syntax** `probe timeout <50-5000>`  
`no probe timeout`

Parameter	Description
<code>&lt;50-5000&gt;</code>	Timeout interval in milliseconds.

**Default** The default timeout interval is 200 milliseconds.

**Mode** DHCP Pool Configuration

**Examples** To set the probe timeout value to 500 milliseconds for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe timeout 500
```

To set the probe timeout value for pool P2 to the default, 200 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe timeout
```

**Related commands**

- [probe enable](#)
- [probe packets](#)
- [probe type](#)
- [show ip dhcp pool](#)

# probe type

**Overview** Use this command to set the probe type for a DHCP pool. The probe type specifies how the DHCP server checks whether an IP address is being used by other hosts, referred to as lease probing. If **arp** is specified, the server sends an ARP request to determine if an address is in use. If **ping** is specified, the server will send an ICMP Echo Request (ping).

The **no** variant of this command sets the probe type to the default setting, ping.

**Syntax** `probe type {arp|ping}`  
`no probe type`

Parameter	Description
arp	Probe using ARP.
ping	Probe using ping.

**Default** The default probe type is ping.

**Mode** DHCP Pool Configuration

**Examples** To set the probe type to `arp` for the pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe type arp
```

To set the probe type for the pool `P2` to the default, `ping`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe type
```

- [probe timeout](#)
- [show ip dhcp pool](#)

# range

**Overview** This command adds an address range to the DHCP address pool you are configuring. The DHCP server responds to client requests received from the pool's network. It assigns an IP addresses within the specified range. The IP address range must lie within the network. You can add multiple address ranges and individual IP addresses for a DHCP pool by using this command multiple times.

The **no** variant of this command removes an address range from the DHCP pool. Use the **no range all** command to remove all address ranges from the DHCP pool.

**Syntax**

```
range <ip-address> [<ip-address>]
no range <ip-address> [<ip-address>]
no range all
```

Parameter	Description
<ip-address>	IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end. Specify only one IP address to add an individual IP address to the address pool.

**Mode** DHCP Configuration

**Examples** To add an address range of 192.0.2.5 to 192.0.2.16 to the pool Nerv\_Office, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# range 192.0.2.5 192.0.2.16
```

To add the individual IP address 192.0.2.2 to a pool, use the command:

```
awplus(dhcp-config)# range 192.0.2.2
```

To remove all address ranges from a pool, use the command:

```
awplus(dhcp-config)# no range all
```

**Related commands**

- [ip dhcp pool](#)
- [service dhcp-server](#)
- [show ip dhcp pool](#)

# route

**Overview** This command allows the DHCP server to provide static routes to clients.

**Syntax** `route A.B.C.D/M A.B.C.D {both|opt249|rfc3442}`

Parameter	Description
A.B.C.D/M	Subnet for the route
A.B.C.D	Next hop for the route
both	opt249 and rfc3442
opt249	Classless static route option for DHCP
rfc3442	Classless static route option for DHCP

**Mode** DHCP Configuration

**Examples** To distribute static routes for route 0.0.0.0/0 whose next hop is 192.16.1.1 to clients using both opt249 and rfc3442, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool public
awplus(dhcp-config)# route 0.0.0.0/0 192.16.1.1 both
```

**Related commands** [ip dhcp pool](#)

# service dhcp-relay

**Overview** This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

**Syntax** `service dhcp-relay`  
`no service dhcp-relay`

**Mode** Global Configuration

**Usage notes** A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

**Default** The DHCP-relay service is enabled by default.

**Examples** To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

**Related commands**

# service dhcp-server

**Overview** This command enables the DHCP server on your device. The server then listens for DHCP requests on all IP interfaces. It will not run if there are no IP interfaces configured.

The **no** variant of this command disables the DHCP server.

**Syntax** `service dhcp-server`  
`no service dhcp-server`

**Mode** Global Configuration

**Example** To enable the DHCP server, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-server
```

**Related commands** [ip dhcp pool](#)  
[show ip dhcp server summary](#)  
[subnet-mask](#)

# short-lease-threshold

**Overview** Use this command to configure a short lease threshold.

Use the **no** variant of this command to return the short lease threshold to the default of one minute.

**Syntax** `short-lease-threshold <hours> <minutes>`  
`no short-lease-threshold`

Parameter	Description
<code>&lt;hours&gt;</code>	The number of hours, from 0 to 24.
<code>&lt;minutes&gt;</code>	The number of minutes, from 0 to 60.

**Default** 1 minute.

**Mode** DHCP Configuration

**Usage notes** DHCP leases need to be backed up in NVS so that when the DHCP server reboots or goes through a power cycle it won't lose all the knowledge of these leases.

Some networks have a high number of mobile devices repeatedly requesting DHCP leases every few seconds before their existing lease expires. This can happen for example, when mobile devices move in and out of a Wi-Fi zone or when Wi-Fi signal strength changes. This means the same IP address can have multiple lease entries which can take up unnecessary backup file space.

The **short-lease-threshold** command allows you to configure the threshold for a short lease, from 1 minute to 24 hours. Any lease less than the threshold is deemed to be a short lease and will NOT be backed up to NVS.

This is useful if you have:

- limited backup file space, and
- you don't need to restore leases after a device reboot or power cycle

**Example** To set the short lease threshold for address pool P2 to 40 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# short-lease-threshold 0 40
```

To set the short lease threshold for address pool Nerv\_Office to 5 hours and 35 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# short-lease-threshold 5 35
```

To return the short lease threshold to the default of one minute, use the following commands:

```
awplus# configure terminal
awplus(config)# no short-lease-threshold
```

# show counter dhcp-client

**Overview** This command shows counters for the DHCP client on your device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter dhcp-client`

**Mode** User Exec and Privileged Exec

**Example** To display the message counters for the DHCP client on your device, use the command:

```
awplus# show counter dhcp-client
```

**Output** Figure 65-2: Example output from the **show counter dhcp-client** command

```
show counter dhcp-client
DHCPDISCOVER out 10
DHCPREQUEST out 34
DHCPCDECLINE out 4
DHCPRELEASE out 0
DHCPPOFFER in 22
DHCPACK in 18
DHCPNAK in 0
```

**Table 1:** Parameters in the output of the **show counter dhcp-client** command

Parameter	Description
DHCPDISCOVER out	The number of DHCP Discover messages sent by the client.
DHCPREQUEST out	The number of DHCP Request messages sent by the client.
DHCPCDECLINE out	The number of DHCP Decline messages sent by the client.
DHCPRELEASE out	The number of DHCP Release messages sent by the client.
DHCPPOFFER in	The number of DHCP Offer messages received by the client.
DHCPACK in	The number of DHCP Acknowledgement messages received by the client.
DHCPNAK in	The number of DHCP Negative Acknowledgement messages received by the client.

# show counter dhcp-relay

**Overview** This command shows counters for the DHCP Relay Agent on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show counter dhcp-relay

**Syntax (VRF-lite)** show counter dhcp-relay [vrf <vrf-name>|global]

Parameter	Description
vrf	Display the output for a VRF instance
<vrf-name>	The name of the specific VRF instance.
global	Display the output for the Global VRF instance

**Mode** User Exec and Privileged Exec

**Examples** To display counters for the DHCP Relay Agent on your device, use the following command:

```
awplus# show counter dhcp-relay
```

**Output** Figure 65-3: Example output from the **show counter dhcp-relay** command

```
awplus#show counter dhcp-relay

Corrupt Agent Option 0
Missing Agent Option 0
Bad Circuit ID 0
Missing Circuit ID 0
Option Insert Failed 0
```

Parameter	Description
Requests In	The number of DHCP Request messages received from clients.
Replies In	The number of DHCP Reply messages received from servers.
Relayed To Server	The number of DHCP Request messages relayed to servers.
Relayed To Client	The number of DHCP Reply messages relayed to clients.
Out To Server Failed	The number of failures when attempting to send request messages to servers. This is an internal debugging counter.
Out To Client Failed	The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.
Invalid hlen	The number of incoming messages dropped due to an invalid hlen field.
Bogus giaddr	The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.
Corrupt Agent Option	The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.

Parameter	Description
Missing Agent Option	The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Bad Circuit ID	The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Missing Circuit ID	The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Bad Remote ID	The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Missing Remote ID	The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.

Parameter	Description
Option Insert Failed	<p>The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when:</p> <ul style="list-style-type: none"> <li>the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the <code>ip dhcp-relay information policy</code> command.</li> <li>there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.</li> </ul>
<p>Note that the following parameters are only used on the Global VRF instance when DHCPv6 is running</p>	
DHCPv6 Requests In	The number of incoming DHCPv6 Request messages.
DHCPv6 Replies In	The number of incoming DHCPv6 Reply messages.
DHCPv6 Relayed to Server	The number of DHCPv6 messages relayed to the server.
DHCPv6 Relayed to Client	The number of DHCPv6 messages relayed to the client.

# show counter dhcp-server

Table 2: Parameters in the output of the **show counter dhcp-server** command

Parameter	Description
DHCPDISCOVER in	The number of Discover messages received by the DHCP server.
DHCPREQUEST in	The number of Request messages received by the DHCP server.
DHCPCDECLINE in	The number of Decline messages received by the DHCP server.
DHCPRELEASE in	The number of Release messages received by the DHCP server.
DHCPINFORM in	The number of Inform messages received by the DHCP server.
DHCPOFFER out	The number of Offer messages sent by the DHCP server.

**Table 2:** Parameters in the output of the **show counter dhcp-server** command

Parameter	Description
DHCPACK out	The number of Acknowledgement messages sent by the DHCP server.
DHCNACK out	The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool.
BOOTREQUEST in	The number of bootp messages received by the DHCP server from bootp clients.
BOOTREPLY out	The number of bootp messages sent by the DHCP server to bootp clients.

# show dhcp lease

**Overview** This command shows details about the leases that the DHCP client has acquired from a DHCP server for interfaces on the device.

For information on filtering and saving command output, see “Controlling “show” Command Output” in the “Getting Started with AlliedWare\_Plus” Feature Overview and Configuration Guide.

**Syntax** `show dhcp lease [<interface>]`

Parameter	Description
<interface>	Interface name to display DHCP lease details for.

**Mode** User Exec and Privileged Exec

**Example** To show the current lease expiry times for all interfaces, use the command:

```
awplus# show dhcp lease
```

To show the current lease for vlan1, use the command:

```
awplus# show dhcp lease vlan1
```

**Output** Figure 65-7: Example output from the **show dhcp lease vlan1** command

```
Interface vlan1

IP Address: 192.168.22.4
Expires: 13 Mar 2021 20:10:19

**Related commands** [ip address dhcp](#)

# show ip dhcp binding

**Overview** This command shows the lease bindings that the DHCP server has allocated clients.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp binding [<ip-address>|<address-pool>]`

**Syntax (VRF-lite)** `show ip dhcp binding [vrf <name>] [<ip-address>|<address-pool>]`

Parameter	Description
<code>vrf</code>	Display the output for a VRF instance
<code>&lt;name&gt;</code>	The name of the specific VRF instance.
<code>&lt;ip-address&gt;</code>	IPv4 address of a leased IP address, in dotted decimal notation. This displays the lease information for the specified IP address.
<code>&lt;address-pool&gt;</code>	Name of an address pool. This displays the lease information for all clients within the address pool.

**Mode** User Exec and Privileged Exec

**Examples** To display all leases for every client in all address pools, use the command:

```
awplus# show ip dhcp binding
```

To display the details for the leased IP address 172.16.2.16, use the command:

```
awplus# show ip dhcp binding 172.16.2.16
```

To display the leases from the address pool MyPool, use the command:

```
awplus# show ip dhcp binding MyPool
```

**Table 3:** Parameters in the output of the **show ip dhcp pool** command

Parameter	Description
Pool	Name of the pool.
network	Subnet and mask length of the pool.
address ranges	Individual IP addresses and address ranges configured for the pool. The DHCP server can offer clients an IP address from within the specified ranges only. Any of these addresses that match an interface address on the device, or a static host address configured in the pool, will be automatically excluded from the range, and a message to this effect will appear beneath the range entry.

**Table 3:** Parameters in the output of the **show ip dhcp pool** command (cont.)

Parameter	Description
static host addresses	The static host addresses configured on the pool. Each IP address is permanently assigned to the client with the matching MAC address. Any of these addresses that match an interface address on the device will be automatically excluded, and a message to this effect will appear beneath the static host entry.
lease <days:hours:minutes>	The lease duration for address allocated by this pool.
domain	The domain name sent by the pool to clients. This is the domain name that the client should use when resolving host names using DNS.
subnet mask	The subnet mask sent by the pool to clients.
Probe - Status	Whether lease probing is enabled or disabled.
Probe - Type	The lease probe type configured. Either ping or ARP.
Probe - Packets	The number of packets sent for each lease probe in the range 0 to 10.
Probe - Timeout	The timeout value in milliseconds to wait for a response after each probe packet is sent. In the range 50 to 5000.
dns servers	The DNS server addresses sent to by the pool to clients.
default-router(s)	The default router addresses sent by the pool to clients.
user-defined options	The list of user-defined options sent by the pool to clients.
Dynamic addresses- Total	The total number of IP addresses that have been configured in the pool for dynamic allocation to DHCP clients.
Dynamic addresses- Leased	The number of IP addresses in the pool that have been dynamically allocated (leased) to DHCP clients.
Dynamic addresses - Utilization	The percentage of IP addresses in the pool that are currently dynamically allocated to clients.
Static host addresses- Total	The number of static IP addresses configured in the pool for specific DHCP client hosts.
Static host addresses - Leased	The number of static IP addresses assigned to specific DHCP client hosts.

# show ip dhcp-relay

**Overview** This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp-relay [interface <interface-name>]`

**Syntax (VRF-lite)** `show ip dhcp-relay [vrf <name>|global] [interface <interface-name>]`

Parameter	Description
<interface-name>	Name of a specific interface. This displays the DHCP configuration for the specified interface only.
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
global	The Global VRF instance.

**Mode** User Exec and Privileged Exec

**Example** To display the DHCP Relay Agent’s configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

**Output** Figure 65-13: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers : 192.168.1.200
```

**Output (VRF-lite)** Figure 65-14: Example output from the **show ip dhcp-relay** command applied for VRF instance red

```
DHCP Relay Service is enabled

[VRF: red]
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is enabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay Information policy is to replace existing relay agent
information
List of servers : 192.168.1.3
```

# show ip dhcp server statistics

**Overview** This command shows statistics related to the DHCP server.

You can display the server counters using the [show counter dhcp-server](#) command as well as with this command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp server statistics`

**Syntax (VRF-lite)** `show ip dhcp server statistics [vrf <name>]`

Parameter	Description
vrf	Display the output for a VRF instance
<name>	The name of the specific VRF instance.

**Mode** User Exec and Privileged Exec

**Example** To display the server statistics, use the command:

```
awplus# show ip dhcp server statistics
```

**Output** Figure 65-15: Example output from the **show ip dhcp server statistics** command

```
DHCP server counters
DHCPDISCOVER in 20
DHCYPREQUEST in 12
DHCPEDECLINE in 1
DHCYPRELEASE in 0
DHCPIFORM in 0

DHCPCACK out 4
DHCPCNAK out 0
BOOTREQUEST in 0
BOOTREPLY out 0
DHCPLEASEQUERY in 0
DHCPLEASEUNKNOWN out 0
DHCPLEASEACTIVE out 0
DHCPLEASEUNASSIGNED out 0
```

**Output (VRF-lite)** Figure 65-16: Example output from the **show ip dhcp server statistics** command for VRF instance red

```

DHCP relay counters
[VRF: RED]
DHCPDISCOVER in 0
DHCPREQUEST in 7
DHCPDECLINE in 0
DHCPRELEASE in 0
DHCPINFORM in 0
DHCPOFFER out 0
DHCPACK out 7
DHCPNAK out 0
BOOTREQUEST in 0
BOOTREPLY out 0
DHCPLEASEQUERY in 0
DHCPLEASEUNKNOWN out 0
DHCPLEASEACTIVE out 0
DHCPLEASEUNASSIGNED out 0

```

Parameter	Description
DHCPDISCOVER in	The number of Discover messages received by the DHCP server.
DHCPREQUEST in	The number of Request messages received by the DHCP server.
DHCPDECLINE in	The number of Decline messages received by the DHCP server.
DHCPRELEASE in	The number of Release messages received by the DHCP server.
DHCPINFORM in	The number of Inform messages received by the DHCP server.
DHCPOFFER out	The number of Offer messages sent by the DHCP server.
DHCPACK out	The number of Acknowledgement messages sent by the DHCP server.
DHCPNAK out	The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool.
BOOTREQUEST in	The number of bootp messages received by the DHCP server from bootp clients.

Parameter	Description
BOOTREPLY out	The number of bootp messages sent by the DHCP server to bootp clients.
DHCPLEASEQUERY in	The number of Lease Query messages received by the DHCP server from DHCP Relay Agents.
DHCPLEASEUNKNOWN out	The number of Lease Unknown messages sent by the DHCP server to DHCP Relay Agents.
DHCPLEASEACTIVE out	The number of Lease Active messages sent by the DHCP server to DHCP Relay Agents.
DHCPLEASEUNASSIGNED out	The number of Lease Unassigned messages sent by the DHCP server to DHCP Relay Agents.

**Related commands**

- `show counter dhcp-server`

- `show ip dhcp pool`

**Command changes** Version 5.5.1-1.1: **vrf <name>** parameter added

# show ip dhcp server summary

**Overview** This command shows the current configuration of the DHCP server. This includes:

- whether the DHCP server is enabled
- whether the DHCP server is configured to ignore BOOTP requests
- whether the DHCP server is configured to support DHCP lease queries
- the details of any user-defined options
- a list of the names of all DHCP address pools currently configured

This show command does not include any configuration details of the address pools. You can display these using the [show ip dhcp pool](#) command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp server summary`

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of the DHCP server, use the command:

```
awplus# show ip dhcp server summary
```

**Output** Figure 65-17: Example output from the **show ip dhcp server summary** command

```
DHCP Server service is disabled
BOOTP ignore is disabled
DHCP leasequery support is disabled
Pool list: p2
```

**Related commands**

- [ip dhcp leasequery enable](#)
- [ip dhcp pool](#)
- [service dhcp-server](#)

# subnet-mask

**Overview** This command sets the subnet mask option for a DHCP address pool you are configuring. Use this command to specify the client's subnet mask as defined in RFC 950. This sets the subnet details using the pre-defined option 1. Note that if you create a user-defined option 1 using the [option](#) command, then you will override any settings created with this command. If you do not specify a subnet mask using this command, then the pool's network mask (specified using the [next-server](#) command) is applied.

The **no** variant of this command removes a subnet mask option from a DHCP pool. The pool reverts to using the pool's network mask.

**Syntax** `subnet-mask <mask>`  
`no subnet-mask`

Parameter	Description
<code>&lt;mask&gt;</code>	Valid IPv4 subnet mask, in dotted decimal notation.

**Mode** DHCP Configuration

**Examples** To set the subnet mask option to 255.255.255.0 for DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# subnet-mask 255.255.255.0
```

To remove the subnet mask option from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no subnet-mask
```

**Related commands**

- [default-router](#)
- [dns-server](#)

# vrf

**Overview** Use this command to add a VRF name to a DHCP server's address pool. This enables the DHCP server to become VRF-aware and allocate IP addresses which are the same as other pools.

One of the benefits of using this command is that it allows you to share DHCP leases across multiple isolated networks.

Use the **no** variant of this command to remove a VRF name from the DHCP server pool.

**Syntax** `vrf <vrf-name>`  
`no vrf`

Parameter	Description
<code>&lt;vrf-name&gt;</code>	The name of the specific VRF instance.

**Default** Global VRF

**Mode** DHCP Configuration

**Usage notes** You need to enter this **vrf** command before entering the [network \(DHCP\)](#) and [range](#) address commands.

For more information, see the [DHCP Feature Overview and Configuration Guide](#).

**Example** To add the VRF name 'red' to the DHCP pool named 'P1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P1
awplus(dhcp-config)# vrf red
```

To remove a VRF name from the DHCP pool named 'P1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P1
awplus(dhcp-config)# no vrf
```

**Related commands** [network \(DHCP\)](#)  
[range](#)

# 66

# DHCP for IPv6 (DHCPv6) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure DHCPv6. For more information, see the [DHCPv6 Feature Overview and Configuration Guide](#).

DHCPv6 is a network protocol used to configure IPv6 hosts with IPv6 addresses and IPv6 prefixes for an IPv6 network. DHCPv6 is used instead of SLAAC (Stateless Address Autoconfiguration) at sites where centralized management of IPv6 hosts is needed. IPv6 routers require automatic configuration of IPv6 addresses and IPv6 prefixes.

DHCPv6 Prefix Delegation provides automatic configuration of IPv6 addresses and IPv6 prefixes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**NOTE:** *The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.*

# address prefix

**Overview** Use this command in DHCPv6 Configuration mode to specify an address prefix for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove the address prefix from the DHCPv6 server pool.

**Syntax** `address prefix <ipv6-prefix/prefix-length> [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]`  
`no address prefix <ipv6-prefix/prefix-length>`

Parameter	Description
<code>&lt;ipv6-prefix/prefix-length&gt;</code>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<code>lifetime</code>	Specify a time period for the hosts to remember router advertisements (RAs). If you specify the optional lifetime parameter with this command then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<code>&lt;valid-time&gt;</code>	Specify a valid lifetime in seconds in the range <5-315360000>. The default valid lifetime is 2592000 seconds.
<code>infinite</code>	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<code>&lt;preferred-time&gt;</code>	Specify a preferred lifetime in seconds in the range <5-315360000>. The default preferred lifetime is 604800 seconds.

**Mode** DHCPv6 Configuration

**Default** The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

**Usage notes** This command creates a pool of prefixes from which addresses are assigned to clients on request, and allocates a network prefix from which the DHCPv6 Server leases addresses. This command is an alternative to using a range set using the [address range](#) command.

The DHCPv6 Server selects an IPv6 address from the range available allocated by the IPv6 prefix, randomly generating the suffix of the IPv6 address, with the specified preferred and valid lifetime leases. Leased IPv6 address are found in the

DHCPv6 Server REPLY packet, which is located within the IANA (Identity Association for Non-temporary Addresses) IA address field in the **REPLY** message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** To add IPv6 address prefix `2001:0db8:1::/48` for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address prefix 2001:0db8:1::/48
```

To remove a configured IPv6 address prefix for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address prefix 2001:0db8:1::/48
```

**Related commands** [address range](#)  
[ipv6 dhcp pool](#)

**Validation Commands** [show ipv6 dhcp binding](#)  
[show ipv6 dhcp pool](#)

# address range

**Overview** Use this command in DHCPv6 Configuration mode to specify an address range for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove an address range from the DHCPv6 server pool.

**Syntax** `address range <first-ipv6-address>  
<last-ipv6-address>[lifetime {<valid-time>|infinite}  
{<preferred-time>|infinite}]  
no address range <first-ipv6-address> <last-ipv6-address>`

Parameter	Description
<code>&lt;first-ipv6-address&gt;</code>	Specify the first IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X:X:X.
<code>&lt;last-ipv6-address&gt;</code>	Specify the last IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X:X:X.
<code>lifetime</code>	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<code>&lt;valid-time&gt;</code>	Specify a valid lifetime in seconds in the range <5-31536000>. The default valid lifetime is 2592000 seconds.
<code>infinite</code>	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<code>&lt;preferred-time&gt;</code>	Specify a preferred lifetime in seconds in the range <5-31536000>. The default preferred lifetime is 604800 seconds.

**Default** The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

**Mode** DHCPv6 Configuration

**Usage** Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** To add the IPv6 address range 2001:0db8:1::1 to 2001:0db8:1fff::1 for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address range 2001:0db8:1::1
2001:0db8:1fff::1
```

To remove a configured IPv6 address range for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address range
```

**Related commands** [address prefix](#)  
[ipv6 dhcp pool](#)

**Validation Commands** [show ipv6 dhcp binding](#)  
[show ipv6 dhcp pool](#)

# clear counter ipv6 dhcp-client

**Overview** Use this command in Privileged Exec mode to clear DHCPv6 client counters.

**Syntax** `clear counter ipv6 dhcp-client`

**Mode** Privileged Exec

**Example** To clear DHCPv6 client counters, use the following command:

```
awplus# clear counter ipv6 dhcp-client
```

**Related commands** [show counter ipv6 dhcp-client](#)

# clear counter ipv6 dhcp-server

**Overview** Use this command in Privileged Exec mode to clear DHCPv6 server counters.

**Syntax** `clear counter ipv6 dhcp-server`

**Mode** Privileged Exec

**Example** To clear DHCPv6 server counters, use the following command:

```
awplus# clear counter ipv6 dhcp-server
```

**Related commands** [show counter ipv6 dhcp-server](#)

# clear ipv6 dhcp binding

**Overview** Use this command in Privileged Exec mode to clear either a specific lease binding or the lease bindings as specified by the command parameters. The command will only take effect on dynamically allocated bindings, not statically configured bindings. This command clears binding entries on the DHCPv6 server binding table.

**Syntax** `clear ipv6 dhcp binding {ipv6 <prefix>|duid <DUID>|all|pool <name>}`

Parameter	Description
<code>ipv6 &lt;prefix&gt;</code>	Optional. Specify the IPv6 prefix of the DHCPv6 client, in hexadecimal notation in the format X:X::X:X.
<code>duid &lt;DUID&gt;</code>	Specify the DUID (DHCPv6 unique ID) of the DHCPv6 client.
<code>all</code>	All DHCPv6 bindings.
<code>pool &lt;name&gt;</code>	Description used to identify DHCPv6 server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks".

**Mode** Privileged Exec

**Usage notes** A specific binding may be deleted by **ipv6** address or **duid** address, or several bindings may be deleted at once using **all** or **pool**.

Note that if you specify to clear the **ipv6** or **duid** address of what is actually a static DHCPv6 binding, an error message is displayed. If **all** or **pool** are specified and one or more static DHCPv6 bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

The `clear ipv6 dhcp binding` command is used as a server function. A binding table entry on the DHCPv6 server is automatically:

- Created whenever a prefix is delegated to a client from the configuration pool.
- Updated when the client renews, rebinds, or confirms the prefix delegation.
- Deleted when the client releases all the prefixes in the binding, all prefix lifetimes have expired, or when a user runs the `clear ipv6 dhcp binding` command.

If the **clear ipv6 dhcp binding** command is used with the optional IPv6 address parameter, only the binding for the specified client is deleted. If the **clear ipv6 dhcp binding** command is used without the optional IPv6 address parameter, then all automatic client bindings are deleted from the DHCPv6 bindings table.

**Example** To clear all dynamic DHCPv6 server binding entries, use the command:

```
awplus# clear ipv6 dhcp binding all
```

**Output** Figure 66-1: Example output from the **clear ipv6 dhcp binding all** command

```
awplus#clear ipv6 dhcp binding all
% Deleted 1 entries
```

**Related commands** [show ipv6 dhcp binding](#)

# clear ipv6 dhcp client

**Overview** Use this command in Privileged Exec mode to restart a DHCPv6 client on an interface.

**Syntax** `clear ipv6 dhcp client <interface>`

Parameter	Description
<code>&lt;interface&gt;</code>	Specify the interface name to restart a DHCPv6 client on.

**Mode** Privileged Exec

**Example** To restart a DHCPv6 client on interface vlan1, use the following command:

```
awplus# clear ipv6 dhcp client vlan1
```

**Related commands** [show ipv6 dhcp binding](#)

# dns-server (DHCPv6)

**Overview** Use this command to add a Domain Name System (DNS) server to the DHCPv6 address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6. Note that if you add a user-defined option 6 using the [option \(DHCPv6\)](#) command, then you will override any settings created with this command.

Use the **no** variant of this command to remove either the specified DNS server or all DNS servers from the DHCPv6 pool.

**Syntax** `dns-server <ipv6-address>`  
`no dns-server [<ipv6-address>]`

Parameter	Description
<code>&lt;ipv6-address&gt;</code>	Specify an IPv6 address of the DNS server, in hexadecimal notation in the format <code>X:X::X:X</code> . This parameter is required when adding a DNS server to the DHCPv6 address pool. All DNS servers are removed from the DHCPv6 pool if you enter the <code>no dns-server</code> command without this parameter.

**Mode** DHCPv6 Configuration

**Examples** To add the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` to the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# dns-server 2001:0db8:3000:3000::32
```

To remove the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` from the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server 2001:0db8:3000:3000::32
```

To remove all DNS servers from the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server
```

**Related commands**    `ipv6 dhcp pool`  
                          `option (DHCPv6)`  
                          `show ipv6 dhcp pool`

# domain-name (DHCPv6)

**Overview** Use this command in DHCPv6 Configuration mode to add a domain name to the DHCPv6 server address pool you are configuring.

Use the **no** variant of this command to remove a domain name from the address pool.

**Syntax** domain-name <domain-name>  
no domain-name

Parameter	Description
<domain-name>	Specify the domain name you wish to assign the DHCPv6 server address pool. Valid characters are printable characters. If the name contains spaces then you must enclose it in "quotation marks".

**Mode** DHCPv6 Configuration

**Usage** This command specifies the domain name that a client should use when resolving host names using the Domain Name System, and sets the domain name details using the pre- defined option 15. Note that if you add a user-defined option 15 using the [option \(DHCPv6\)](#) command, then you will override any settings created with this command.

**Examples** To add the domain name `Engineering` to DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# domain-name Engineering
```

To remove the domain name `Engineering` from DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no domain-name Engineering
```

**Related commands** [dns-server \(DHCPv6\)](#)  
[option \(DHCPv6\)](#)  
[show ipv6 dhcp pool](#)

# ip dhcp-relay agent-option

**Overview** This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands `ip dhcp-relay agent-option` and `ip dhcp-relay information policy` have been configured.*

**Syntax**

```
ip dhcp-relay agent-option
no ip dhcp-relay agent-option
```

**Default** DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the [ip dhcp-relay max-message-length](#) command.

This command cannot be enabled if DHCP snooping is enabled on your device ([service dhcp-snooping](#) command), and vice versa.

**Examples** To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

**Related commands**

- `ip dhcp-relay agent-option remote-id`
- `ip dhcp-relay information policy`
- `ip dhcp-relay max-message-length`
- `service dhcp-relay`

# ip dhcp-relay agent-option subscriber-id-auto-mac

**Overview** This command causes the relay agent to insert the requesting clients' MAC address into a subscriber ID field in the relay header. A suitably-configured server can then use this subscriber ID option to assign the same IPv6 address to that requesting client every time it requires an address.

Use the no form of this command to disable this feature.

**Syntax** `ip dhcp-relay agent-option subscriber-id-auto-mac`  
`no ip dhcp-relay agent-option subscriber-id-auto-mac`

**Default** Disabled

**Usage notes** By default, DHCPv6 uses a DUID-LLT client identifier instead of a MAC address. This is generated by the operating system when DHCP first starts. If the OS is reinstalled the DUID-LLT can change, and any multiple operating systems on the machine will all have different DUIDs.

Configuring the subscriber-id-auto-mac option causes the relay agent to insert the requesting client's MAC address into a subscriber ID field in the relay header. A suitably-configured server can then use this subscriber ID to assign the same IPv6 address to that requesting client every time it connects.

The client must be in the same L2 network as the relay. If there are multiple relays between the client and the server, only the first relay will add a subscriber ID option.

**Example** To enable this feature on VLAN1, use the following commands:

```
awplus(config)#int vlan1
awplus(config-if)#ip dhcp-relay agent-option
subscriber-id-auto-mac
```

For an example of how to configure a relay agent and server, see the document "How to use DHCPv6 to assign specific IPv6 addresses to specific devices", available from [www.alliedtelesis.com](http://www.alliedtelesis.com).

# ip dhcp-relay agent-option checking

**Overview** This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that [ip dhcp-relay agent-option](#) must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option checking`  
`no ip dhcp-relay agent-option checking`

**Mode** Interface Configuration for a VLAN interface.

**Examples** To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

**Related commands** [ip dhcp-relay agent-option](#)  
[ip dhcp-relay agent-option remote-id](#)  
[ip dhcp-relay information policy](#)  
[service dhcp-relay](#)

# ip dhcp-relay agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax**

```
ip dhcp-relay agent-option remote-id <remote-id>
no ip dhcp-relay agent-option remote-id
```

Parameter	Description
<remote-id>	An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed.

**Default** The Remote ID is set to the device's MAC address by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

**Examples** To set the Remote ID to myid for client DHCP packets received on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [show ip dhcp-relay](#)

# ip dhcp-relay information policy

**Overview** This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.

**Syntax**

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

Parameter	Description
append	The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.
drop	The DHCP Relay Agent discards the packet.
keep	The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.
replace	The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet.

**Mode** Interface Configuration for a VLAN interface.

**Examples** To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [service dhcp-server](#)

# ip dhcp-relay maxhops

**Overview** This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay maxhops <1-255>`  
`no ip dhcp-relay maxhops`

Parameter	Description
<1-255>	The maximum hop count value.

**Default** The default hop count threshold is 10 hops.

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay max-message-length

**Overview** This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay max-message-length <548-1472>`  
`no ip dhcp-relay max-message-length`

Parameter	Description
<548-1472>	The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes).

**Default** The default is 1400 bytes.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

**NOTE:** Before setting this command, you must first run the `ip dhcp-relay agent-option` command. This will allow the DHCP Relay Agent Option 82 fields to be appended.

**Example** To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface `vlan2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay server-address

**Overview** This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax**

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay
```

Parameter	Description
<ipv4-address>	Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D.
<ipv6-address>	Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.
<server-interface>	Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the [service dhcp-relay](#) command to enable the DHCP Relay Agent on your device. The [ip dhcp-relay server-address](#) command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

**Examples** To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

**Related commands** [service dhcp-relay](#)

# ipv6 address (DHCPv6 PD)

**Overview** Use this command in Interface Configuration mode for a VLAN interface to append an IPv6 address suffix to the IPv6 prefix provided by a DHCPv6 Prefix Delegation (PD) server.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

**Syntax** `ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]`  
`no ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]`

Parameter	Description
<code>&lt;ipv6-prefix-name&gt;</code>	The IPv6 prefix name advertised on the router advertisement message sent from the device. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.
<code>&lt;ipv6-addr/prefix-length&gt;</code>	Specifies the IPv6 address to be set, for example <code>::1/64</code> . The IPv6 address uses the format <code>X::X:X/Prefix-Length</code> . The prefix-length is usually set between 0 and 64.
<code>[eui64]</code>	EUI-64 is a method of automatically deriving the lower 64 bits of an IPv6 address, based on the switch's MAC address.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** When specifying the **eui64** parameter, the interface identifier of the IPv6 address is derived from the MAC address of the device.

For more information about EUI64, see the [IPv6 Feature Overview and Configuration Guide](#).

**Examples** To configure a PD prefix named `prefix1` on interface `vlan1` and then add an IPv6 address, use the following commands. In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix will be `::1` for the last 64 bits:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1::1/64
```

To configure a PD prefix named `prefix1` on interface `vlan1` and then add an IPv6 address using EUI-64 identifiers, use the following commands. In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix is created from the EUI-64 identifier of the interface for the last 64 bits:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1/64 eui64
```

To assign the IPv6 address `2001:0db8::a2/48` to the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/48
```

To remove the IPv6 address `2001:0db8::a2/48` from the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/48
```

To assign the **eui64** derived address in the prefix `2001:db8::/64` to VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:db8::/64 eui64
```

To remove the **eui64** derived address in the prefix `2001:db8::/32` from VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:db8::/64 eui64
```

**Validation  
Commands**

`show running-config`  
`show ipv6 dhcp binding`  
`show ipv6 interface`  
`show ipv6 route`

**Related  
commands**

`ipv6 dhcp client pd`  
`ipv6 dhcp pool`  
`ipv6 local pool`  
`ipv6 nd prefix (DHCPv6)`  
`prefix-delegation pool`

# ipv6 address dhcp

**Overview** Use this command to activate the DHCPv6 client on the interface that you are configuring. This allows the interface to use the DHCPv6 client to obtain its IPv6 configuration details from a DHCPv6 server on its connected network.

The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

Use the **no** variant of this command to stop the interface from obtaining IPv6 configuration details from a DHCPv6 server.

The DHCPv6 client supports the following IP configuration options:

- Option 1—the subnet mask for your device.
- Option 3—a list of default routers.
- Option 6—a list of DNS servers. This list appends the DNS servers set on your device with the [dns-server \(DHCPv6\)](#) command.
- Option 15—a domain name used to resolve host names. This option replaces any domain name that you have set with the [domain-name \(DHCPv6\)](#) command.
- Option 51—lease expiration time.

**Syntax** `ipv6 address dhcp [default-route-to-server]`  
`no ipv6 address dhcp`

Parameter	Description
<code>default-route-to-server</code>	Allow the automatic configuration of a default route to the DHCPv6 server. This option is not enabled by default when you enable the DHCP client on an interface.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** Use the **default-route-to-server** option to allow the automatic configuration of a default route to the DHCPv6 server. Note that this option is not enabled by default when you enable the DHCP client on an interface.

**Examples** To set the interface `vlan2` to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 address dhcp
```

To stop the interface vlan2 from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address dhcp
```

**Related  
commands**

[clear ipv6 dhcp client](#)  
[ipv6 address](#)  
[ipv6 address \(DHCPv6 PD\)](#)  
[show ipv6 dhcp interface](#)  
[show running-config](#)

# ipv6 dhcp client pd

**Overview** Use this command in Interface Configuration mode to enable the DHCPv6 client process and enable requests for prefix delegation through the interface that you are configuring.

Use the **no** variant of this command to disable requests for prefix delegation. This is the default setting.

For further information about DHCPv6 Prefix Delegation, which is used to automate the process of assigning prefixes, see the [DHCPv6 Feature Overview and Configuration Guide](#).

**Syntax** `ipv6 dhcp client pd <prefix-name> <default-route-to-server>`  
`no ipv6 dhcp client pd`

Parameter	Description
<code>&lt;prefix-name&gt;</code>	Specify an IPv6 general prefix name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".
<code>&lt;default-route-to-server&gt;</code>	Specify the default route to the DHCP server

**Mode** Interface Configuration

**Default** Prefix delegation is disabled by default on an interface.

**Usage notes** Entering the **ipv6 dhcp client pd** command starts the DHCPv6 client process if not already running, and enables requests for prefix delegation through the interface on which the command is configured.

When prefix delegation is enabled and a prefix is acquired, the prefix is stored in the IPv6 prefix pool with an internal name defined by the required `<prefix-name>` placeholder parameter. The [ipv6 address](#) command can then refer to the prefixes stored in the IPv6 prefix pool.

**Examples** To enable prefix delegation with the prefix name `prefix-name` on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd my-prefix-name
```

To disable prefix delegation on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp client pd
```

**Related  
commands**

- ipv6 enable
- clear ipv6 dhcp client
- ipv6 address (DHCPv6 PD)
- ipv6 nd prefix (DHCPv6)
- show ipv6 dhcp binding
- show ipv6 dhcp interface

# ipv6 dhcp option

**Overview** Use this command in Global Configuration mode to create a user-defined DHCPv6 option. You can then use this option when configuring a DHCPv6 server address pool, by using the [option \(DHCPv6\)](#) command.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Use the **no** variant of this command to remove either the specified user-defined option. This also removes user-defined options from the associated DHCPv6 server address pools.

**Syntax** `ipv6 dhcp option <1-254> [name <option-name>] [<option-type>]`  
`no ipv6 dhcp option <1-254>|<option-name>`

Parameter	Description										
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.										
<option-name>	Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". Default: no default										
<option-type>	The option value. You must specify a value that is appropriate to the option type: <table border="1"><tbody><tr><td>ascii</td><td>An ASCII text string</td></tr><tr><td>hex</td><td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td></tr><tr><td>ipv6</td><td>An IPv6 address or prefix that has hexadecimal notation in the format HHHH : HHHH : : HHHH : HHHH. To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.</td></tr><tr><td>integer</td><td>A number from 0 to 4294967295.</td></tr><tr><td>flag</td><td>A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b>, <b>on</b>, or <b>enabled</b> will set the flag. <b>false</b>, <b>off</b> or <b>disabled</b> will unset the flag.</td></tr></tbody></table>	ascii	An ASCII text string	hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.	ipv6	An IPv6 address or prefix that has hexadecimal notation in the format HHHH : HHHH : : HHHH : HHHH. To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.	integer	A number from 0 to 4294967295.	flag	A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.
ascii	An ASCII text string										
hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.										
ipv6	An IPv6 address or prefix that has hexadecimal notation in the format HHHH : HHHH : : HHHH : HHHH. To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.										
integer	A number from 0 to 4294967295.										
flag	A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.										

**Mode** Global Configuration

**Examples** To define a user-defined ASCII string option as option 66, without a name, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name "tcpip-node-type", use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name special-address, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option 12
```

To remove the specific user-defined option with the option name perform-router-discovery, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option perform-router-discovery
```

**Related commands**

[dns-server \(DHCPv6\)](#)  
[domain-name \(DHCPv6\)](#)  
[option \(DHCPv6\)](#)  
[show ipv6 dhcp](#)

# ipv6 dhcp pool

**Overview** Use this command in Global Configuration mode to enter the DHCPv6 Configuration mode for the DHCPv6 server pool name as specified in the required command parameter. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCPv6 configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCPv6 server pools on devices with multiple interfaces. This allows the device to act as a DHCPv6 server on multiple interfaces to distribute different information to clients on the different networks.

Use the **no** variant of this command to delete the specific DHCPv6 pool.

**Syntax** `ipv6 dhcp pool <DHCPv6-poolname>`  
`no ipv6 dhcp pool <DHCPv6-poolname>`

Parameter	Description
<code>&lt;DHCPv6-poolname&gt;</code>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

**Mode** Global Configuration

**Usage** All DHCPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

**Examples** To create the DHCPv6 pool named P2 and enter DHCPv6 configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)#
```

To delete the DHCPv6 pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp pool P2
```

**Related commands**

- ipv6 local pool
- option (DHCPv6)
- prefix-delegation pool

- show ipv6 dhcp pool

# ipv6 dhcp server

**Overview** Use this command in Interface Configuration mode to enable DHCPv6 server for the current IPv6 configured interface to use the specified DHCPv6 server pool name.

The DHCPv6 server service listens for DHCPv6 requests on the IPv6 configured interface. The DHCPv6 server service does not run on interfaces without IPv6 configured on them.

Use the **no** variant of this command to disable the DHCPv6 server.

**Syntax** `ipv6 dhcp-server [<DHCPv6-poolname>]`  
`no ipv6 dhcp-server`

Parameter	Description
<DHCPv6-poolname>	Specify a named DHCPv6 server pool as defined with the <code>ipv6 dhcp pool</code> command. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

**Mode** Interface Configuration

**Usage notes** The **ipv6 dhcp server** command enables the DHCPv6 service on a specified interface using the pool for prefix delegation and configuration through the specified interface.

Note that DHCPv6 client, DHCPv6 server and DHCPv6 relay are mutually exclusive on an interface. When one of the DHCPv6 functions is enabled on an interface then another DHCPv6 function cannot be enabled on the same interface.

**Examples** To enable the DHCPv6 server service and use the DHCPv6 pool named P2 on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 dhcp server P2
```

To disable the DHCPv6 server on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp server
```

**Related commands** `ipv6 dhcp pool`  
`show ipv6 dhcp binding`  
`show ipv6 dhcp pool`

# ipv6 local pool

**Overview** Use this command in Global Configuration mode to configure a local DHCPv6 server prefix delegation pool specifying a poolname and a prefix/prefix length. You can optionally exclude the locally assigned prefix from the pool with the **exclude-local-prefix** keyword.

Use the **no** variant of this command to remove a local DHCPv6 server prefix delegation pool specifying the poolname.

**Syntax** `ipv6 local pool <DHCPv6-poolname> <delegated-prefix-name>  
<ipv6-prefix/prefix-length> <assigned-length>  
[exclude-local-prefix]`  
`no ipv6 local pool`

Parameter	Description
<code>&lt;DHCPv6-poolname&gt;</code>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".
<code>&lt;delegated-prefix-name&gt;</code>	Description used to identify the delegated prefix name from the parent PD (Prefix Delegation) server. If the name contains spaces then you must enclose it in "quotation marks".
<code>&lt;ipv6-prefix/prefix-length&gt;</code>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<code>&lt;assigned-length&gt;</code>	Specify an IPv6 prefix length assigned to the user from the pool in the range <1-128>. Note that the value of the <i>assigned-length</i> parameter entered cannot be less than or equal to the <i>prefix-length</i> parameter value entered. An assigned length must be longer than a prefix length.
<code>exclude-local-prefix</code>	Specify this keyword to exclude the locally assigned prefix from the pool.

**Default** No DHCPv6 server prefix delegation pool is configured by default.

**Mode** Global Configuration

**Usage notes** All IPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

**Examples** To create a local DHCPv6 local pool named P2 with the IPv6 prefix and prefix length 2001:0db8::/32 with an assigned length of 64, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 local pool P2 2001:0db8::/32 64
```

To remove a configured DHCPv6 local pool, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 local pool
```

**Related commands** [ipv6 dhcp pool](#)  
[show ipv6 dhcp pool](#)

## ipv6 nd prefix (DHCPv6)

**Overview** Use this command to specify IPv6 RA (Router Advertisement) prefix information generated from the DHCPv6 server for DHCPv6 prefix-delegation for a VLAN.

Use the **no** variant of this command to remove IPv6 RA prefix information from the DHCPv6 Server for DHCPv6 Prefix-Delegation for the interface. Use the **all** parameter with the **no** variant of this command to remove all prefix names and all prefixes for an interface.

**Syntax** `ipv6 nd prefix <ipv6-prefix-name>  
<ipv6-prefix/length>{<valid-lifetime>|infinite}  
{<preferred-lifetime>|infinite} {off-link|no-autoconfig}`  
`no ipv6 nd prefix {<ipv6-prefix-name>|<ipv6-prefix/length>|all}`

Parameter	Description
<code>&lt;ipv6-prefix-name&gt;</code>	The IPv6 prefix name advertised on the router advertisement message sent from the device. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.
<code>&lt;ipv6-prefix/length&gt;</code>	The IPv6 prefix and prefix length advertised on the router advertisement message sent from the device. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<code>&lt;valid-lifetime&gt;</code>	The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 5 and 315360000 seconds. Note that this period should be set to a value greater than that set for the prefix preferred-lifetime. See the Usage notes after this parameter table for a description of valid lifetime and how it determines invalid IPv6 addresses upon expiry.
<code>infinite</code>	Specifying this keyword instead of entering a value for the <code>&lt;valid-lifetime&gt;</code> parameter applies an infinite valid lifetime.
<code>&lt;preferred-lifetime&gt;</code>	Specifies the IPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered current. Set this to a value between 0 and 315360000 seconds. Note that this period should be set to a value less than that set for the prefix valid-lifetime. See the Usage notes after this parameter table for a description of preferred lifetime and how it determines deprecated IPv6 addresses upon expiry.
<code>infinite</code>	Specifying this keyword instead of entering a value for the <code>&lt;preferred-lifetime&gt;</code> parameter applies an infinite valid lifetime.
<code>off-link</code>	Specify the IPv6 prefix off-link flag.
<code>no-autoconfig</code>	Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration.
<code>all</code>	Specify all prefix names and all prefixes are removed when used with the no variant of this command.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** The following example configures the device to issue RAs (Router Advertisements) on the VLAN interface vlan2, and advertises the DHCPv6 prefix name prefix1 and the IPv6 address prefix of 2001:0db8::/32.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 nd prefix prefix1 2001:0db8::/32
```

The following example resets router advertisements on the VLAN interface vlan2, so the address prefix of 2001:0db8::/32 is not advertised from the device.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/32
```

The following example removes all prefix names and prefixes from VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix all
```

- [prefix-delegation pool](#)
- [show ipv6 dhcp binding](#)

# link-address

**Overview** Use this command in DHCPv6 Configuration mode to specify a link-address prefix within a DHCPv6 Server pool.

Note that you can only configure one link address per DHCPv6 pool. Configuring another link address in the same DHCPv6 pool overwrites the previously configured link address.

Use the **no** variant of this command to remove the link-address prefix from the DHCPv6 Server pool.

**Syntax** `link-address <ipv6-prefix/prefix-length>`  
`no link-address`

Parameter	Description
<code>&lt;ipv6-prefix/prefix-length&gt;</code>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X/Prefix-Length. The prefix-length is usually set between 0 and 64.

**Default** No DHCPv6 Server pool configuration link address prefix is configured by default.

**Mode** DHCPv6 Configuration

**Usage notes** Link addresses are configured in DHCPv6 Server address pools when there are remote clients that communicate via intermediate relay(s).

RELAY-FORW and RELAY-REPL relay packets contain the requesting link address source.

This command is used to match incoming requests from PD (Prefix Delegation) clients (received via an intermediate relay) to a configured delegation pool.

When an address on the incoming interface of the DHCPv6 server or a link address set in the incoming delegation request packet from the prefix delegation client matches the link-address prefix configured in the delegation pool, the DHCPv6 server is able to match and use the appropriate delegation pool for relayed delegation request messages.

If there is no match between incoming delegation request packets from the prefix delegation client and the link-address prefix configured in the delegation pool, the DHCPv6 Server does not delegate an IPv6 prefix to the requesting device.

The link address should be set to the network prefix where the prefix delegation client resides. The prefix delegation server will also need a forwarding path (IPv6 route) back to the network prefix where the prefix delegation client resides.

For more information, see the [DHCPv6 Feature Overview and Configuration Guide](#).

**Examples** To configure the IPv6 prefix and prefix length 2001:0db8:1::/48 as the link address for pool P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# address prefix 2001:0db8:2::/48
awplus(config-dhcp6)# link-address 2001:0db8:1::/48
```

To remove the link address, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no link-address
```

**Related commands** [ipv6 dhcp pool](#)  
[show ipv6 dhcp pool](#)

# option (DHCPv6)

**Overview** Use this command in DHCPv6 Configuration mode to add a user-defined option to the DHCPv6 prefix pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value.

Use the **no** variant of this command to remove the specified user-defined option from the DHCPv6 server pool, or to remove all user-defined options from the DHCPv6 server pool.

**Syntax** `option [<1-254>|<option-name>] <option-value>`  
`no option [<1-254>|<option-value>]`

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name associated with the option.	
<option-value>	The option value. You must specify a value that is appropriate to the option type:	
	hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	ipv6	An IPv6 prefix that has the hexadecimal X:X::X:X notation. To create a list of IPv6 prefixes, you must add each IPv6 prefix individually using this command multiple times.
	integer	A number from 0 to 4294967295.
	flag	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.

**Mode** DHCPv6 Configuration

**Usage** You must define a DHCPv6 option using the `ipv6 dhcp option` command before using the `option (DHCPv6)` command.

Note that options with an **ipv6** type can hold a list of IPv6 prefix (i.e. entries that have the X:X::X:X address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IPv6 prefixes. Also note options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

**Examples** To add the IPv6 type option named `sntp-server-addr` to the pool P2 and give the option the value `ipv6`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 22 name sntp_server_addr ipv6
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option sntp_server_addr ipv6
```

To add the ASCII-type option named `tftp-server-name` to the pool P2 and give the option the value `server1`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool P2 and give the option the value `08af`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option 175, use the following commands:

```
awplus(config-dhcp6)# option 175 2001:0db8:3001::/64
awplus(config-dhcp6)# option 175 2001:0db8:3002::/64
awplus(config-dhcp6)# option 175 2001:0db8:3003::/64
```

To add the option 179 to a pool, and give the option the value `123456`, use the following command:

```
awplus(config-dhcp6)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the following command:

```
awplus(config-dhcp6)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the following command:

```
awplus(config-dhcp6)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the following command:

```
awplus(config-dhcp6)# no option tftp-server-name
```

# prefix-delegation pool

**Overview** Use this command in DHCPv6 Configuration mode to add a DHCPv6 server prefix-delegation pool entry to the current DHCPv6 pool configuration. You must define a DHCPv6 server prefix-delegation pool using the `ipv6 dhcp pool` command before using this command.

Use the **no** variant of this command to remove a DHCPv6 server prefix-delegation pool from the current DHCPv6 pool configuration.

**Syntax** `prefix-delegation pool <DHCPv6-poolname> [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]`  
`no prefix-delegation pool <DHCPv6-poolname>`

Parameter	Description
<code>&lt;DHCPv6-poolname&gt;</code>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".
<code>lifetime</code>	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<code>&lt;valid-time&gt;</code>	Specify a valid lifetime in seconds in the range <code>&lt;5-315360000&gt;</code> .
<code>infinite</code>	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<code>&lt;preferred-time&gt;</code>	Specify a valid lifetime in seconds in the range <code>&lt;5-315360000&gt;</code> .

**Default** No IPv6 local prefix pool is specified by default.

**Mode** DHCPv6 Configuration

**Usage notes** The DHCPv6 server assigns prefixes dynamically from an IPv6 local prefix pool, which is configured using the `ipv6 local pool` command and is associated with a DHCPv6 configuration pool using this command. When the server receives a prefix request from a client, it attempts to obtain unassigned prefixes from the pool. After the client releases the previously assigned prefixes, the server returns the prefixes to the pool for reassignment.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source

address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Example** This example adds DHCPv6 Prefix Delegation pool pd\_pool1 to DHCPv6 pool pool1:

```
awplus# configure terminal
awplus(config)# ipv6 local pool pd_pool1 2001:0db8::/48 56
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# prefix-delegation pool pd_pool1
```

**Related commands**

- [ipv6 local pool](#)
- [show ipv6 dhcp pool](#)

# service dhcp-relay

**Overview** This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

**Syntax** `service dhcp-relay`  
`no service dhcp-relay`

**Mode** Global Configuration

**Usage notes** A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

**Default** The DHCP-relay service is enabled by default.

**Examples** To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

# show counter dhcp-relay

**Overview** This command shows counters for the DHCP Relay Agent on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show counter dhcp-relay

**Syntax (VRF-lite)** show counter dhcp-relay [vrf <vrf-name>|global]

Parameter	Description
vrf	Display the output for a VRF instance
<vrf-name>	The name of the specific VRF instance.
global	Display the output for the Global VRF instance

**Mode** User Exec and Privileged Exec

**Examples** To display counters for the DHCP Relay Agent on your device, use the following command:

```
awplus# show counter dhcp-relay
```

**Output** Figure 66-2: Example output from the **show counter dhcp-relay** command

```
awplus#show counter dhcp-relay

Parameter	Description
Requests In	The number of DHCP Request messages received from clients.
Replies In	The number of DHCP Reply messages received from servers.
Relayed To Server	The number of DHCP Request messages relayed to servers.
Relayed To Client	The number of DHCP Reply messages relayed to clients.
Out To Server Failed	The number of failures when attempting to send request messages to servers. This is an internal debugging counter.
Out To Client Failed	The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.
Invalid hlen	The number of incoming messages dropped due to an invalid hlen field.
Bogus giaddr	The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.
Corrupt Agent Option	The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.

Parameter	Description
Missing Agent Option	The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Bad Circuit ID	The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Missing Circuit ID	The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Bad Remote ID	The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Missing Remote ID	The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.

Parameter	Description
Option Insert Failed	<p>The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when:</p> <ul style="list-style-type: none"> <li>the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the <code>ip dhcp-relay information policy</code> command.</li> <li>there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.</li> </ul>
<p>Note that the following parameters are only used on the Global VRF instance when DHCPv6 is running</p>	
DHCPv6 Requests In	The number of incoming DHCPv6 Request messages.
DHCPv6 Replies In	The number of incoming DHCPv6 Reply messages.
DHCPv6 Relayed to Server	The number of DHCPv6 messages relayed to the server.
DHCPv6 Relayed to Client	The number of DHCPv6 messages relayed to the client.

# show counter ipv6 dhcp-client

**Overview** Use this command in User Exec or Privilege Exec mode to show DHCPv6 client counter information. See [show counter ipv6 dhcp-server](#) for DHCPv6 server information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter ipv6 dhcp-client`

**Mode** User Exec and Privileged Exec

**Example** To display the DHCPv6 client counter information, use the command:

```
awplus# show counter ipv6 dhcp-client
```

**Output** Figure 66-4: Example output from the **show counter ipv6 dhcp-client** command

```
awplus#show counter ipv6 dhcp-client
SOLICIT out 20
ADVERTISE in 12
REQUEST out 1
CONFIRM out 0
RENEW out 0
REBIND out 0
REPLY in 0
RELEASE out 0
DECLINE out 0
INFORMATION-REQUEST out 0
```

**Table 1:** Parameters in the output of the **show counter ipv6 dhcp-client** command

Parameter	Description
SOLICIT out	Displays the count of SOLICIT messages sent by the DHCPv6 client.
ADVERTISE in	Displays the count of ADVERTISE messages received by the DHCPv6 client.
REQUEST out	Displays the count of REQUEST messages sent by the DHCPv6 client.
CONFIRM out	Displays the count of CONFIRM messages sent by the DHCPv6 client.
RENEW out	Displays the count of RENEW messages sent by the DHCPv6 client.

**Table 1:** Parameters in the output of the **show counter ipv6 dhcp-client** command (cont.)

Parameter	Description
REBIND out	Displays the count of REBIND messages sent by the DHCPv6 client.
REPLY in	Displays the count of REPLY messages received by the DHCPv6 client.
RELEASE out	Displays the count of RELEASE messages sent by the DHCPv6 client.
DECLINE out	Displays the count of DECLINE messages sent by the DHCPv6 client.
INFORMATION-REQUEST out	Displays the count of INFORMATION-REQUEST messages sent by the DHCPv6 client.

**Related commands** [show counter ipv6 dhcp-server](#)

# show counter ipv6 dhcp-server

**Overview** Use this command in User Exec or Privileged Exec mode to show DHCPv6 server counter information. See [show counter ipv6 dhcp-client](#) for DHCPv6 client information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter ipv6 dhcp-server`

**Mode** User Exec and Privileged Exec

**Example** To display the DHCPv6 server counter information, use the command:

```
awplus# show counter ipv6 dhcp-server
```

**Output** Figure 66-5: Example output from the **show counter ipv6 dhcp-server** command

```
awplus#show counter ipv6 dhcp-server

```

**Table 2:** Parameters in the output of the **show counter ipv6 dhcp-server** command

Parameter	Description
SOLICIT in	Displays the count of SOLICIT messages received by the DHCPv6 server.
ADVERTISE out	Displays the count of ADVERTISE messages sent by the DHCPv6 server.
REQUEST in	Displays the count of REQUEST messages received by the DHCPv6 server.
CONFIRM in	Displays the count of CONFIRM messages received by the DHCPv6 server.

**Table 2:** Parameters in the output of the **show counter ipv6 dhcp-server** command (cont.)

Parameter	Description
RENEW in	Displays the count of RENEW messages received by the DHCPv6 server.
REBIND in	Displays the count of REBIND messages received by the DHCPv6 server.
REPLY out	Displays the count of REPLY messages sent by the DHCPv6 server.
RELEASE in	Displays the count of RELEASE messages received by the DHCPv6 server.
DECLINE in	Displays the count of DECLINE messages received by the DHCPv6 server.
INFORMATION-REQUEST in	Displays the count of INFORMATION-REQUEST messages received by the DHCPv6 server
RELAY FORWARD in	Displays the count of Relay forward in messages received by the DHCPv6 server
LEASEQUERY in	Displays the count of LEASE QUERY messages received by the DHCPv6 server
DHCPv4 QUERY in	Displays the count of DHCPv4 QUERY messages received by the DHCPv6 server

**Related commands** [show counter ipv6 dhcp-client](#)

# show ip dhcp-relay

**Overview** This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp-relay [interface <interface-name>]`

**Syntax (VRF-lite)** `show ip dhcp-relay [vrf <name>|global] [interface <interface-name>]`

Parameter	Description
<interface-name>	Name of a specific interface. This displays the DHCP configuration for the specified interface only.
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
global	The Global VRF instance.

**Mode** User Exec and Privileged Exec

**Example** To display the DHCP Relay Agent’s configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

**Output** Figure 66-6: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers : 192.168.1.200
```

**Output (VRF-lite)** Figure 66-7: Example output from the **show ip dhcp-relay** command applied for VRF instance red

```
DHCP Relay Service is enabled

[VRF: red]
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is enabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay Information policy is to replace existing relay agent
information
List of servers : 192.168.1.3
```

# show ipv6 dhcp

**Overview** Use this command in User Exec or Privileged Exec mode to show the DHCPv6 unique identifier (DUID) configured on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp`

**Mode** User Exec and Privileged Exec

**Usage notes** The DUID is based on the link-layer address for both DHCPv6 client and DHCPv6 server identifiers. The device uses the MAC address from the lowest interface number for the DUID.

The DUID is used by a DHCPv6 client to obtain an IPv6 address from a DHCPv6 server. A DHCPv6 server compares the DUID with its database of DUIDs and sends configuration data for an IPv6 address plus the preferred and valid lease time values to a DHCPv6 client.

**Example** To display the DUID configured on your device, use the command:

```
awplus# show ipv6 dhcp
```

**Output** Figure 66-8: Example output from the **show ipv6 dhcp** command

```
awplus#show ipv6 dhcp
DHCPv6 Server DUID: 0001000117ab6876001577f7ba23
```

**Related commands** [ipv6 address dhcp](#)

# show ipv6 dhcp binding

**Overview** Use this command in User Exec or Privileged Exec mode to show the IPv6 address entries that the DHCPv6 server leases to DHCPv6 clients. Note that applying this command with the optional *summary* keyword parameter displays the number of addresses per pool, but not the address or prefix entries per pool.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp binding [summary]`

Parameter	Description
<code>summary</code>	Optional. Specify the <b>summary</b> keyword to display summarized information for DHCPv6 server leases to client nodes, displaying the number of address entries per pool, not the addresses or prefixes.

**Mode** User Exec and Privileged Exec

**Example 1** To display the total DHCPv6 leasing address entries for all pools, use the command:

```
awplus# show ipv6 dhcp binding summary
```

**Output** Figure 66-9: Example output from the **show ipv6 dhcp binding summary** command

```
awplus# show ipv6 dhcp binding summary
Pool Name Number of Leased Addresses

ia-na1 3
ia-pd1 5
Total in all Pools: 8
```

**Table 3:** Parameters in the output of the **show ipv6 dhcp binding summary** command

Parameter	Description
Pool Name	Displays a list of all the pool names.
Number of Leased Addresses	Displays the number of leased address entries for the pool.
Total in all Pools	Displays the total number of leased address entries for all pools.

**Example 2** To display addresses, prefixes, and lifetimes for all DHCPv6 leasing entries by pool, enter:

```
awplus# show ipv6 dhcp binding
```

**Output** Figure 66-10: Example output from the **show ipv6 dhcp binding** command

```
awplus#show ipv6 dhcp binding
Pool ia-na1
 Address 2002:0:3c0::1
 client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
 preferred lifetime 604800, valid lifetime 2592000
 starts at 20 Aug 2012 18:38:29
 expires at 19 Sep 2012 18:38:29
Pool ia-pd1
 Prefix 2002:0:3c0::/42
 client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
 preferred lifetime 604800, valid lifetime 2592000
 starts at 20 Aug 2012 18:38:29
 expires at 19 Sep 2012 18:38:29
```

**Table 4:** Parameters in the output of the **show ipv6 dhcp binding** command

Parameter	Description
Address	Address delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.
Prefix	Prefix delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.
DUID	DHCPv6 unique identifier (DUID) (see RFC 3315). Each DHCPv6 client has as DUID. DHCPv6 servers use DUIDs to identify clients for the association of IAs (Identity Associations) with DHCPv6 clients. DHCPv6 clients use DUIDs to identify a DHCPv6 server.
IAID	Identify Association Identifier (IAID) (see RFC 3315). IAIDs are identifiers for IAs (Identity Associations), where an IA is a collection of IPv6 addresses assigned to a DHCPv6 client. Each IA has an associated IAD. Each DHCPv6 client may have more than one IA assigned to it. Each IA holds one type of address.
preferred lifetime	The preferred lifetime setting in seconds for the specified IAID and DUID. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.
valid lifetime	The valid lifetime setting in seconds for the specified IAID and DUID. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Table 4:** Parameters in the output of the **show ipv6 dhcp binding** command

Parameter	Description
starts at	The date and time at which the valid lifetime expires.
expires at	The date and time at which the valid lifetime expires.

**Related  
commands**

[clear ipv6 dhcp binding](#)  
[ipv6 dhcp pool](#)  
[show ipv6 dhcp pool](#)

# show ipv6 dhcp interface

**Overview** Use this command in User Exec or Privileged Exec mode to display DHCPv6 information for a specified interface, or all interfaces when entered without the interface parameter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp interface [<interface-name>]`

Parameter	Description
<code>&lt;interface-name&gt;</code>	Optional. Specify the name of the interface to show DHCPv6 information about. Omit this optional parameter to display DHCPv6 information for all interfaces DHCPv6 is configured on.

**Mode** User Exec and Privileged Exec

**Example 1** To display DHCPv6 information for all interfaces DHCPv6 is configured on, use the command:

```
awplus# show ipv6 dhcp interface
```

**Output** Figure 66-11: Example output from the **show ipv6 dhcp interface** command

```
awplus# show ipv6 dhcp interface
vlan1 is in client mode
 Address 1001::3c0:1
 preferred lifetime 9000, valid lifetime 5000
 starts at 20 Jan 2012 09:21:35
 expires at 20 Jan 2012 10:25:32

vlan2
is in client (Prefix-Delegation) mode
 Prefix name pd1
 prefix 2002:0:3c0::/42
 preferred lifetime 604800, valid lifetime 2592000
 starts at 20 Aug 2012 09:21:33
 expires at 19 Sep 2012 09:21:33

vlan3 is in server mode
 Using pool : pool-1; Preference:0
```

**Example 2** To display DHCPv6 information for interface vlan2, use the command:

```
awplus# show ipv6 dhcp interface vlan2
```

**Output** Figure 66-12: Example output from the **show ipv6 dhcp interface** command for a specific interface

```
awplus# show ipv6 dhcp interface vlan2
vlan2 is in client (Prefix-Delegation) mode
 Prefix name pdl
 prefix 2002:0:3c0::/42
 preferred lifetime 604800, valid lifetime 2592000
 starts at 20 Aug 2012 09:21:33
 expires at 19 Sep 2012 09:21:33
```

**Table 5:** Parameters in the output of the **show counter dhcp-client** command

Parameter	Description
<interface> is in server/client/(Prefix-Delegation) mode	Displays whether the specified interface is in server or client mode and whether prefix-delegation is applied to an interface.
Address	Displays the address of the DHCPv6 server on the interface.
Prefix name	Displays the IPv6 general prefix pool name, where prefixes are stored for the interface.
Using pool	Displays the name of the pool used by the interface.
Preference	Displays the preference value for the DHCPv6 server.

**Related commands** [ipv6 dhcp client pd](#)

# show ipv6 dhcp pool

**Overview** Use this command in User Exec or Privileged Exec mode to display the configuration details and system usage of the DHCPv6 address pools configured on the device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp pool [<DHCPv6-address-pool-name>]`

Parameter	Description
<DHCPv6-address-pool-name>	Name of a specific DHCPv6 address pool. This displays the configuration of the specified DHCPv6 address pool only.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 dhcp pool`

**Output** Figure 66-13: Example output from the **show ipv6 dhcp pool** command

```
awplus# show ipv6 dhcp pool
DHCPv6 Pool: ia-na
Address Prefix : 1001::/64
 Lifetime: 2592000(valid), 604800(preferred)
DNS Server: 2001::1
DNS Server: 2001::2
Domain Name: example.com
Domain Name: example.co.jp
SNTP Server: 2001::5
SNTP Server: 2001::6
Option Code : 150
 Value: [ASCII] test-test
DHCPv6 Pool: ia-pd
PD Pool Name: pd1
Prefix : 2002::/38-42
Lifetime : 2592000(valid), 604800(preferred)
```

**Table 6:** Parameters in the output of the **show ipv6dhcp pool** command

Parameter	Description
DHCPv6 Pool	Name of the DHCPv6 pool.
Address Prefix	Address prefix to the DHCPv6 pool.

**Table 6:** Parameters in the output of the **show ipv6dhcp pool** command (cont.)

Parameter	Description
Address Lifetime	Valid and preferred lifetimes to the DHCPv6 pool. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.
DNS Server	IPv6 address of the DNS Server
Domain name	URL for the domain name.
SNTP Server	IPv6 address of the SNTP (Simple Network Time Protocol) Server.
Option Code	DHCP Option code (see RFC 2132).
Option Value	DHCP Option value type (see RFC 2132).

**Related commands** [ipv6 dhcp pool](#)

# sntp-address

**Overview** Use this command in DHCPv6 Configuration mode to add an SNTP Server IPv6 address to a DHCPv6 Server pool.

Use the **no** variant of this command to remove an SNTP Server IPv6 address from a DHCPv6 Server pool.

**Syntax** `sntp-address <ipv6-address>`  
`no sntp-address <ipv6-address>`

Parameter	Description
<code>&lt;ipv6-address&gt;</code>	Specify an SNTP Server IPv6 address, in hexadecimal notation in the format X:X::X:X.

**Mode** DHCPv6 Configuration

**Examples** The following example adds an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# sntp-address 2001:0db8::/32
```

The following example removes an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no sntp-address 2001:0db8::/32
```

# NTP Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the Network Time Protocol (NTP). For more information, see the [NTP Feature Overview and Configuration Guide](#).

The device can act as an NTP client to receive time from one or more NTP servers, and as an NTP server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

- Command List**
- [“ntp authentication-key”](#) on page 3757
  - [“ntp broadcastdelay”](#) on page 3759
  - [“ntp master”](#) on page 3760
  - [“ntp peer”](#) on page 3761

  - [“show ntp status”](#) on page 3774

# ntp authentication-key

**Overview** This command defines each of the authentication keys. Each key has a key number, a type (MD5 or SHA1), and a value.

The **no** variant of this disables the authentication key.

**Syntax** `ntp authentication-key <keynumber> md5 <key-string> [trusted]`  
`ntp authentication-key <keynumber> sha1 <key-string> [trusted]`

When in secure mode, MD5 is not available and the syntax in config files will be:

```
ntp authentication-key <keynumber> sha1-encrypted
<encrypted-key-string> [trusted]
no ntp authentication-key <keynumber>
```

Parameter	Description
<keynumber>	<1-4294967295> An identification number for the key.
md5	Define an MD5 key.
sha1	Define an SHA1 key.
<key-string>	The authentication key. For SHA1, this is a 20 hexadecimal character string. For MD5, this is a string of up to 31 ASCII characters.
sha1-encrypted	This parameter indicates in running config that the key is in its encrypted form instead of in plaintext. If secure mode is enabled and you enter a SHA1 key, the running config will display this sha1-encrypted parameter instead of sha1, and will display the key in encrypted form. Do not enter a key using the sha1-encrypted parameter. Instead, enter sha1 and the unencrypted key string.
<encrypted-key-string>	The encrypted authentication key.
trusted	Add this key to the list of authentication keys that this server trusts.

**Mode** Global Configuration

**Examples** To define an MD5 authentication key number 134343 and a key value 'mystring', use the commands:

```
awplus# configure terminal
awplus(config)# ntp authentication-key 134343 md5 mystring
```

To disable the authentication key number 134343 with the key value 'mystring', use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ntp authentication-key 134343
```

**Command  
changes**

Version 5.4.9-2.1 sha1-encrypted parameter added.

# ntp broadcastdelay

**Overview** Use this command to set the estimated round-trip delay for broadcast packets. Use the **no** variant of this command to reset the round-trip delay for broadcast packets to the default offset of 0 microseconds.

**Syntax** `ntp broadcastdelay <delay>`  
`no ntp broadcastdelay`

Parameter	Description
<code>&lt;delay&gt;</code>	<code>&lt;1-999999&gt;</code> The broadcast delay in microseconds.

**Default** 0 microsecond offset, which can only be applied with the **no** variant of this command.

**Mode** Global Configuration

**Examples** To set the estimated round-trip delay to 23464 microseconds for broadcast packets, use these commands:

```
awplus# configure terminal
awplus(config)# ntp broadcastdelay 23464
```

To reset the estimated round-trip delay for broadcast packets to the default setting (0 microseconds), use these commands:

```
awplus# configure terminal
awplus(config)# no ntp broadcastdelay
```

# ntp master

**Overview** Use this command to make the device to be an authoritative NTP server, even if the system is not synchronized to an outside time source.

Use the **no** variant of this command to stop the device being the designated NTP server.

**Syntax** `ntp master [<stratum>]`  
`no ntp master`

Parameter	Description
<stratum>	<1-15> The stratum number defines the configured level that is set for this master within the NTP hierarchy. The default stratum number is 12.

**Mode** Global Configuration

**Usage notes** The stratum levels define the distance from the reference clock and exist to prevent cycles in the hierarchy. Stratum 1 is used to indicate time servers, which are more accurate than Stratum 2 servers. For more information on the Network Time Protocol go to: [www.ntp.org](http://www.ntp.org)

**Examples** To stop the device from being the designated NTP server, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp master
```

To make the device the designated NTP server with stratum number 2, use the commands:

```
awplus# configure terminal
awplus(config)# ntp master 2
```

# ntp peer

**Overview** Use this command to configure an NTP peer association. An NTP association is a peer association if this system is willing to either synchronize to the other system, or allow the other system to synchronize to it.

Use the **no** variant of this command to remove the configured NTP peer association.

**Syntax** `ntp peer {<peeraddress>|<peername>}`  
`ntp peer {<peeraddress>|<peername>} [prefer] [key <key>]`  
`[version <version>]`  
`no ntp peer {<peeraddress>|<peername>}`

Parameter	Description
<peeraddress>	Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address.
<peername>	Specify the peer hostname. The peer hostname can resolve to an IPv4 and an IPv6 address.
prefer	Prefer this peer when possible.
key <key>	<1-4294967295> Configure the peer authentication key.
version <version>	<1-4> Configure for this NTP version.

**Mode** Global Configuration

**Examples** See the following commands for options to configure NTP peer association, key and NTP version for the peer with an IPv4 address of 192.0.2.23:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23
awplus(config)# ntp peer 192.0.2.23 prefer
awplus(config)# ntp peer 192.0.2.23 prefer version 4
awplus(config)# ntp peer 192.0.2.23 prefer version 4 key 1234
awplus(config)# ntp peer 192.0.2.23 version 4 key 1234
awplus(config)# ntp peer 192.0.2.23 version 4
awplus(config)# ntp peer 192.0.2.23 key 1234
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 192.0.2.23
```

See the following commands for options to configure NTP peer association, key and NTP version for the peer with an IPv6 address of 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# ntp peer 2001:0db8:010d::1
awplus(config)# ntp peer 2001:0db8:010d::1 prefer
awplus(config)# ntp peer 2001:0db8:010d::1 prefer version 4
awplus(config)# ntp peer 2001:0db8:010d::1 prefer version 4 key
1234
awplus(config)# ntp peer 2001:0db8:010d::1 version 4 key 1234
awplus(config)# ntp peer 2001:0db8:010d::1 version 4
awplus(config)# ntp peer 2001:0db8:010d::1 key 1234
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 2001:0db8:010d::1
```

**Related  
commands** [ntp server](#)  
[ntp source](#)

# ntp rate-limit

**Overview** Use this command to enable NTP server response rate-limiting. Limiting NTP server responses can reduce network traffic when occurrences such as misconfigured or broken NTP clients poll the NTP server too frequently. Excessive polling can lead to network overload.

Use the **no** variant of this command to remove the rate-limit configuration.

**Syntax** `ntp rate-limit {interval<1-4096>|burst <1-255>|leak <2-16>}`  
`no ntp rate-limit`

Parameter	Description
interval	The minimum interval between responses configured in seconds. The default interval is 8 seconds.
burst	The maximum number of responses that can be sent in a burst, temporarily exceeding the limit specified by the interval option. The default burst is 8 responses.
leak	The rate at which responses are randomly allowed even if the limits specified by the interval and burst options are exceeded. The default leak is 4, i.e. on average, every fourth request has a response.

**Mode** Global Configuration

**Default** Interval - 8 seconds.

Burst - 8 responses.

Leak - 4.

**Example** To configure an NTP rate-limiting interval of 30 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# ntp rate-limit interval 30
```

**Related commands** [ntp restrict](#)

**Command changes** Version 5.4.8-1.1: command added

# ntp restrict

**Overview** Use this command to configure a restriction (allow or deny) on NTP packets or NTP functionality for a specific host/network or all hosts of a given IP family.

This means you can control host access to NTP service and NTP server status queries.

Use the **no** variant of this command to remove a restriction from one or more hosts.

**Syntax**

```
ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
{allow|deny}

ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} query
{allow|deny}

ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} serve
{allow|deny}

no ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
```

Parameter	Description
default-v4	Apply this restriction to all IPv4 hosts.
default-v6	Apply this restriction to all IPv6 hosts.
<host-address>	Apply this restriction to the specified IPv4 or IPv6 host. Enter an IPv4 address in the format A.B.C.D. Enter an IPv6 address in the format X::X:X.
<host-subnet>	Apply this restriction to the specified IPv4 subnet or IPv6 prefix. Enter an IPv4 subnet in the format A.B.C.D/M. Enter an IPv6 prefix in the format X::X:X/X.
query	Control NTP server status queries to matching hosts.
serve	Control NTP time service to matching hosts.
allow	Allow the configured restriction.
deny	Deny the configured restriction.

**Default** By default, time service is allowed to all hosts, and NTP server status querying is denied to all hosts.

**Mode** Global Configuration

**Example** To prevent all IPv4 hosts from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict default-v4 deny
```

To prevent the host 192.168.1.1 from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 198.168.1.1 deny
```

To allow all hosts in the 10.10.10.0/24 subnet to access a device for NTP server status, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 10.10.10.0/24 query allow
```

**Related commands** [ntp rate-limit](#)

**Command changes** Version 5.4.8-1.1: command added

# ntp server

**Overview** Use this command to configure an NTP server. This means that this system will synchronize to the other system, and not vice versa.

Use the **no** variant of this command to remove the configured NTP server.

**Syntax**

```
ntp server {<serveraddress>|<servername>}
ntp server {<serveraddress>|<servername>} [prefer] [key <key>]
[version <version>]
no ntp server {<serveraddress>|<servername>}
```

Parameter	Description
<serveraddress>	Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address.
<servername>	Specify the server hostname. The server hostname can resolve to an IPv4 and an IPv6 address.
prefer	Prefer this server when possible.
key <key>	<1-4294967295> Configure the server authentication key.
version <version>	<1-4> Configure for this NTP version.

**Mode** Global Configuration

**Examples** See the following commands for options to configure an NTP server association, key and NTP version for the server with an IPv4 address of 192.0.1.23:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.1.23
awplus(config)# ntp server 192.0.1.23 prefer
awplus(config)# ntp server 192.0.1.23 prefer version 4
awplus(config)# ntp server 192.0.1.23 prefer version 4 key 1234
awplus(config)# ntp server 192.0.1.23 version 4 key 1234
awplus(config)# ntp server 192.0.1.23 version 4
awplus(config)# ntp server 192.0.1.23 key 1234
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.1.23, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp server 192.0.1.23
```

See the following commands for options to configure an NTP server association, key and NTP version for the server with an IPv6 address of 2001:0db8:010e::2:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2
awplus(config)# ntp server 2001:0db8:010e::2 prefer
awplus(config)# ntp server 2001:0db8:010e::2 prefer version 4
awplus(config)# ntp server 2001:0db8:010e::2 prefer version 4
key 1234
awplus(config)# ntp server 2001:0db8:010e::2 version 4 key 1234
awplus(config)# ntp server 2001:0db8:010e::2 version 4
awplus(config)# ntp server 2001:0db8:010e::2 key 1234
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp server 2001:0db8:010e::2
```

**Related  
commands** [ntp peer](#)  
[ntp source](#)

# ntp source

**Overview** Use this command to configure an IPv4 or an IPv6 address for the NTP source interface. This command defines the socket used for NTP messages, and only applies to NTP client behavior.

Note that you cannot use this command when using AMF (Allied Telesis Management Framework) or VCStack.

Use the **no** variant of this command to remove the configured IPv4 or IPv6 address from the NTP source interface.

**Syntax** `ntp source <source-address>`  
`no ntp source`

Parameter	Description
<code>&lt;source-address&gt;</code>	Specify the IP address of the NTP source interface, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address.

**Default** An IP address is selected based on the most appropriate egress interface used to reach the NTP peer if a configured NTP client source IP address is unavailable or invalid.

**Mode** Global Configuration

**Usage notes** Adding an IPv4 or an IPv6 address allows you to select which source interface NTP uses for peering. The IPv4 or IPv6 address configured using this command is matched to the interface.

When selecting a source IP address to use for NTP messages to the peer, if the configured NTP client source IP address is unavailable then default behavior will apply, and an alternative source IP address is automatically selected. This IP address is based on the most appropriate egress interface used to reach the NTP peer. The configured NTP client source IP may be unavailable if the interface is down, or an invalid IP address is configured that does not reside on the device.

Note that this command only applies to NTP client behavior. The egress interface that the NTP messages use to reach the NTP server is determined by the `ntp peer` and `ntp server` commands.

Note that you cannot use this command when using AMF (Allied Telesis Management Framework).

**Examples** To configure the NTP source interface with the IPv4 address 192.0.2.23, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 192.0.2.23
```

To configure the NTP source interface with the IPv6 address 2001:0db8:010e::2, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 2001:0db8:010e::2
```

To remove a configured address for the NTP source interface, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp source
```

**Related commands**

- [ntp peer](#)
- [ntp server](#)

# show ntp associations

**Overview** Use this command to display the status of NTP associations.

**Syntax** show ntp associations

**Mode** User Exec and Privileged Exec

**Example** See the sample output of the **show ntp associations** command displaying the status of NTP associations.

Table 67-1: Example output from **show ntp associations**

```
awplus#show ntp associations
remote refid st t when poll reach delay offset disp

*server1.example.com
 192.0.2.2 4 u 47 64 377 0.177 0.021 0.001
+192.168.1.10 10.32.16.80 5 u 46 64 377 0.241 -0.045 0.000
* system peer, # backup, + candidate, - outlier, x false ticker
```

Table 67-2: Parameters in the output from **show ntp associations**

Parameter	Description
* system peer	The peer that NTP uses to calculate variables like the offset and root dispersion of this AlliedWare Plus device. NTP passes these variables to the clients using this AlliedWare Plus device.
# backup	Peers that are usable, but are not among the first six peers sorted by synchronization distance. These peers may not be used.
+ candidate	Peers that the NTP algorithm has determined can be used, along with the system peer, to discipline the clock (i.e. to set the time on the AlliedWare Plus device).
- outlier	Peers that are not used because their time is significantly different from the other peers.
x false ticker	Peers that are not used because they are not consider trustworthy.
space	Peers that are not used because they are, for example, unreachable.
remote	The peer IP address
refid	The IP address of the reference clock, or an abbreviation indicating the type of clock (e.g. GPS indicates that the server uses GPS for the reference clock). INIT indicates that the reference clock is initializing, so it is not operational.

Table 67-2: Parameters in the output from **show ntp associations** (cont.)

Parameter	Description
st	The stratum, which is the number of hops between the server and the accurate time source such as an atomic clock.
t	Type, one of: u: unicast or manycast client b: broadcast or multicast client l: local reference clock s: symmetric peer A: manycast server B: broadcast server M: multicast server
when	When last polled (seconds ago, h hours ago, or d days ago).
poll	Time between NTP requests from the device to the server.
reach	An indication of whether or not the NTP server is responding to requests. 0 indicates there has never been a successful poll; 1 indicates that the last poll was successful; 3 indicates that the last two polls were successful; 377 indicates that the last 8 polls were successful.
delay	The round trip communication delay to the remote peer or server, in milliseconds.
offset	The mean offset (phase) in the times reported between this local host and the remote peer or server (root mean square, milliseconds).
disp	The amount of clock error (in milliseconds) of the server due to clock resolution, network congestion, etc.

# show ntp counters

**Overview** This command displays packet counters for NTP.

**Syntax** show ntp counters

**Mode** Privileged Exec

**Example** To display counters for NTP use the command:

```
awplus# show ntp counters
```

Figure 67-1: Example output from **show ntp counters**

```
awplus#show ntp counters
Server Received 4
Server Dropped 0
Client Sent 90
Client Received 76
Client Valid Received 76
```

Table 67-3: Parameters in the output from **show ntp counters**

Parameter	Description
Server Received	Number of NTP packets received from NTP clients.
Server Dropped	Number of NTP packets received from NTP clients but dropped.
Client Sent	Number of NTP packets sent to servers.
Client Received	Number of NTP packets received from servers
Client Valid Received	Number of valid NTP packets received from servers.

# show ntp counters associations

**Overview** Use this command to display NTP packet counters for individual servers and peers.

**Syntax** show ntp counters associations

**Mode** Privileged Exec

**Examples** To display packet counters for each NTP server and peer that is associated with a device, use the command:

```
awplus# show ntp counters associations
```

**Output** Figure 67-2: Example output from **show ntp counters associations**

```
awplus#show ntp counters associations
Peer 2001::1
 sent: -
 received: -
Peer 10.37.219.100
 sent: 7
 received: 7
```

Table 67-4: Parameters in the output from **show ntp counters associations**

Parameter	Description
Peer	An NTP peer or server that the device is associated with.
sent	The number of NTP packets that this device sent to the peer.
received	The number of NTP packets that this device received from the peer.

**Related commands** [ntp restrict](#)

# show ntp status

**Overview** Use this command to display the status of the Network Time Protocol (NTP).

**Syntax** show ntp status

**Mode** User Exec and Privileged Exec

**Example** To see information about NTP status, use the command:

```
awplus# show ntp status
```

For information about the output displayed by this command, see [ntp.org](http://ntp.org).

Figure 67-3: Example output from **show ntp status**

```
awplus#show ntp status
Reference ID : COA8010A (192.168.1.10)
Stratum : 4
Ref time (UTC) : Fri Jun 15 05:32:38 2018
System time : 0.000002004 seconds fast of NTP time
Last offset : -0.002578615 seconds
RMS offset : 0.000928071 seconds

# Precision Time Protocol (PTP) and Transparent Clock Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Precision Time Protocol (PTP) and Transparent Clock.

For more information, see the [Precision Time Protocol \(PTP\) and Transparent Clock Feature Overview and Configuration Guide](#).

- Command List**
- [“clock-port”](#) on page 3776
  - [“ptp-clk”](#) on page 3777
  - [“ptp global”](#) on page 3779
  - [“show ptp data transparent”](#) on page 3780
  - [“show ptp port”](#) on page 3781

# clock-port

**Overview** Use this command to associate the port with the clock and enable the required PTP functionality for 1588v2 packets entering and leaving this port. For the transparent clock, this specifically means modification of the Correction Factor to reflect the residence time in the bridge.

Use the **no** variant of this command to remove the port from the clock and disable modification of the Correction Factor.

**Syntax** `clock-port`  
`no clock-port`

**Default** Ports are unassociated and disabled with the clock by default.

**Mode** Interface Configuration (port)

**Example** To configure the clock-port on port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# clock-port
```

To remove port1.0.1 from the clock and disable modification of the Correction Factor, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no clock-port
```

**Related commands** [ptp global](#)  
[ptp-clk](#)  
[show ptp data transparent](#)  
[show ptp port](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.8-0.2: added to x230, x550 series products

# ptp-clk

**Overview** Use this command to configure the PTP clock instance on the switch. All values must be specified.

Use the **no** variant of this command to disable the clock and disable timing support on any other ports that were set as clock-ports.

**Syntax** `ptp-clk {ordinary|boundary|transparent} transport-type {udp {v4|v6}|ethernet} delay-mechanism {e2e|p2p} step-type {onestep|twostep}`  
`no ptp-clk`

Parameter	Description
ordinary	An ordinary clock, able to act as Master, Slave, or Grand Master
boundary	A clock able to manage downstream fan-out for an upstream Master
transparent	A device that acts as a bridge between a Master and a Slave and participates in the timing protocol by adding the bridge residence time to the correction factor in the packets
udp v4	Timing protocol forwarded in IPv4 UDP Packets
udp v6	Timing protocol forwarded in IPv6 UDP Packets
ethernet	Timing protocol forwarded in Ethernet frames
e2e	Specifies that the clock supports end to end messaging sequences between the Master and the Slave and that the Correction Factor is updated based on the Bridge residence time. A Delay_Request sequence is required to determine the link delay
p2p	Specifies that the clock supports end to end messaging sequences between the Master and the Slave as well as peer to peer messaging sequences to determine the link delay between this device and its peers. The Correction Factor is updated based on the Bridge residence time plus the peer to peer link delay - so there is no need for a delay_request message sequence.
onestep	Specifies that the clock supports modification of the correction factor as the message is transiting the switch
twostep	Specifies that the clock requires that a follow-up message be sent that is used to carry the correction factor for the previous 1588v2 message (sync, delay_request or pdelay_req)

**Default** This command is disabled by default.

**Mode** Global configuration

**Usage notes** The clock is not active until the PTP timing service is enabled via the **ptp global** command. It is not possible to make a port a clock port - if the clock has not been configured.

**Example** To configure a PTP instance on the switch, use the following commands:

```
awplus# configure terminal
awplus(config)# ptp-clk transparent transport-type ethernet
delay-mechanism e2e step-type onestep
```

**Related commands** [ptp global](#)  
[show ptp data transparent](#)  
[show ptp port](#)

**Command changes** Version 5.4.7- 0.1: command added  
Version 5.4.8-0.2: added to x230, x550 series products

# ptp global

**Overview** Use this command to enable 1588v2 based timing support on the device.  
Use the **no** variant of this command to disable the timing support.

**Syntax** `ptp global`  
`no ptp global`

**Default** Disabled

**Mode** Global Configuration

**Example** To enable 1588v2 timing support on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# ptp global
```

To disable 1588v2 timing support on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ptp global
```

**Related commands** [clock-port](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.8-0.2: added to x230, x550 series products

# show ptp data transparent

**Overview** Use this command to display configuration information for the PTP transparent clock.

**Syntax** `show ptp data transparent`

**Mode** Privileged Exec

**Example** To display configuration for PTP transparent clock, use the following command:

```
awplus# show ptp data transparent
```

**Output** Figure 68-1: Example output from **show ptp data transparent**

```
IE300-1#show ptp data transparent

# alias (interface)

**Overview** Use this command to set an alias name for a port, as returned by the SNMP ifMIB in OID 1.3.6.1.2.1.31.1.1.1.18.

Use the **no** variant of this command to remove an alias name from a port.

**Syntax** `alias <ifAlias>`  
`no alias`

Parameter	Description
<code>&lt;ifAlias&gt;</code>	64 character name for an interface in a network management system. All printable characters are valid.

**Default** Not set.

**Mode** Interface Configuration

**Usage notes** The interface alias can also be set via SNMP.

Third-party management systems often use standard MIBs to access device information. Network managers can specify an alias interface name to provide a non-volatile way to access the interface.

**Example** To configure the alias interface name 'uplink\_a' for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# alias uplink_a
```

To remove an alias interface name from port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no alias
```

**Command changes** Version 5.4.8-2.1: command added

# debug snmp

**Overview** This command enables SNMP debugging.

The **no** variant of this command disables SNMP debugging.

**Syntax**

```
debug snmp
[all|detail|error-string|process|receive|send|xdump]

no debug snmp
[all|detail|error-string|process|receive|send|xdump]
```

Parameter	Description
all	Enable or disable the display of all SNMP debugging information.
detail	Enable or disable the display of detailed SNMP debugging information.
error-string	Enable or disable the display of debugging information for SNMP error strings.
process	Enable or disable the display of debugging information for processed SNMP packets.
receive	Enable or disable the display of debugging information for received SNMP packets.
send	Enable or disable the display of debugging information for sent SNMP packets.
xdump	Enable or disable the display of hexadecimal dump debugging information for SNMP packets.

**Mode** Privileged Exec and Global Configuration

**Example** To start SNMP debugging, use the command:

```
awplus# debug snmp
```

To start SNMP debugging, showing detailed SNMP debugging information, use the command:

```
awplus# debug snmp detail
```

To start SNMP debugging, showing all SNMP debugging information, use the command:

```
awplus# debug snmp all
```

**Related commands**

- [show debugging snmp](#)
- [terminal monitor](#)
- [undebug snmp](#)

# show counter snmp-server

**Overview** This command displays counters for SNMP messages received by the SNMP agent.

**Syntax** `show counter snmp-server`

**Mode** User Exec and Privileged Exec

**Example** To display the counters for the SNMP agent, use the command:

```
awplus# show counter snmp-server
```

**Output** Figure 69-1: Example output from the **show counter snmp-server** command

```
SNMP-SERVER counters
inPkts 11

NotInTimeWindows 0
UnknownUserNames 0
UnknownEngineIDs 0
WrongDigest 0
DecryptionErrors 0
UnknownSecModels 0
InvalidMsgs 0
UnknownPDUHandlers 0
```

**Table 1:** Parameters in the output of the **show counter snmp-server** command

Parameter	Meaning
inPkts	The total number of SNMP messages received by the SNMP agent.
inBadVersions	The number of messages received by the SNMP agent for an unsupported SNMP version. It drops these messages. The SNMP agent on your device supports versions 1, 2C, and 3.
inBadCommunityNames	The number of messages received by the SNMP agent with an unrecognized SNMP community name. It drops these messages.
inBadCommunityUses	The number of messages received by the SNMP agent where the requested SNMP operation is not permitted from SNMP managers using the SNMP community named in the message.
inASNParseErrs	The number of ASN.1 or BER errors that the SNMP agent has encountered when decoding received SNMP Messages.
inTooBig	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'tooBig'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inNoSuchNames	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'noSuchName'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inBadValues	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'badValue'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inReadOnly	The number of valid SNMP PDUs received by the SNMP agent where the value of the error-status field is 'readOnly'. The SNMP manager should not generate a PDU which contains the value 'readOnly' in the error-status field. This indicates that there is an incorrect implementations of the SNMP.
inGenErrs	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'genErr'.

**Table 1:** Parameters in the output of the **show counter snmp-server** command

Parameter	Meaning
<code>inTotalReqVars</code>	The number of MIB objects that the SNMP agent has successfully retrieved after receiving valid SNMP Get-Request and Get-Next PDUs.
<code>inTotalSetVars</code>	The number of MIB objects that the SNMP agent has successfully altered after receiving valid SNMP Set-Request PDUs.
<code>inGetRequests</code>	The number of SNMP Get-Request PDUs that the SNMP agent has accepted and processed.
<code>inGetNexts</code>	The number of SNMP Get-Next PDUs that the SNMP agent has accepted and processed.
<code>inSetRequests</code>	The number of SNMP Set-Request PDUs that the SNMP agent has accepted and processed.
<code>inGetResponses</code>	The number of SNMP Get-Response PDUs that the SNMP agent has accepted and processed.
<code>inTraps</code>	The number of SNMP Trap PDUs that the SNMP agent has accepted and processed.
<code>outPkts</code>	The number of SNMP Messages that the SNMP agent has sent.
<code>outTooBig</code>	The number of SNMP PDUs that the SNMP agent has generated with the value 'tooBig' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
<code>outNoSuchNames</code>	The number of SNMP PDUs that the SNMP agent has generated with the value 'noSuchName' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
<code>outBadValues</code>	The number of SNMP PDUs that the SNMP agent has generated with the value 'badValue' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
<code>outGenErrs</code>	The number of SNMP PDUs that the SNMP agent has generated with the value 'genErr' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
<code>outGetRequests</code>	The number of SNMP Get-Request PDUs that the SNMP agent has generated.

**Table 1:** Parameters in the output of the **show counter snmp-server** command

Parameter	Meaning
outGetNexts	The number of SNMP Get-Next PDUs that the SNMP agent has generated.
outSetRequests	The number of SNMP Set-Request PDUs that the SNMP agent has generated.
outGetResponses	The number of SNMP Get-Response PDUs that the SNMP agent has generated.
outTraps	The number of SNMP Trap PDUs that the SNMP agent has generated.
UnsupportedSecurityLevels	The number of received packets that the SNMP agent has dropped because they requested a securityLevel unknown or not available to the SNMP agent.
NotInTimeWindows	The number of received packets that the SNMP agent has dropped because they appeared outside of the authoritative SNMP agent's window.
UnknownUserNames	The number of received packets that the SNMP agent has dropped because they referenced an unknown user.
UnknownEngineIDs	The number of received packets that the SNMP agent has dropped because they referenced an unknown snmpEngineID.
WrongDigest	The number of received packets that the SNMP agent has dropped because they didn't contain the expected digest value.
DecryptionErrors	The number of received packets that the SNMP agent has dropped because they could not be decrypted.
UnknownSecModels	The number of messages received that contain a security model that is not supported by the server. Valid for SNMPv3 messages only.
InvalidMsgs	The number of messages received where the security model is supported but the authentication fails. Valid for SNMPv3 messages only.
UnknownPDUHandlers	The number of times the SNMP handler has failed to process a PDU. This is a system debugging counter.

**Related commands** [show snmp-server](#)

# show debugging snmp

**Overview** This command displays whether SNMP debugging is enabled or disabled.

**Syntax** `show debugging snmp`

**Mode** User Exec and Privileged Exec

**Example** To display the status of SNMP debugging, use the command:

```
awplus# show debugging snmp
```

**Output** Figure 69-2: Example output from the **show debugging snmp** command

```
Sntp (SMUX) debugging status:
Sntp debugging is on
```

**Related commands** [debug snmp](#)

# show running-config snmp

**Overview** This command displays the current configuration of SNMP on your device.

**Syntax** `show running-config snmp`

**Mode** Privileged Exec

**Example** To display the current configuration of SNMP on your device, use the command:

```
awplus# show running-config snmp
```

**Output** Figure 69-3: Example output from the **show running-config snmp** command

```
snmp-server contact AlliedTelesis
snmp-server location Philippines
snmp-server group grou1 auth read view1 write view1 notify view1
snmp-server view view1 1 included
snmp-server community public
snmp-server user user1 group1 auth md5 password priv des
password
```

**Related commands** [show snmp-server](#)

# show snmp-server

**Overview** This command displays the status and current configuration of the SNMP server.

**Syntax** `show snmp-server`

**Mode** Privileged Exec

**Example** To display the status of the SNMP server, use the command:

```
awplus# show snmp-server
```

**Output** Figure 69-4: Example output from the **show snmp-server** command

```
SNMP Server Enabled
IP Protocol IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) 0x80001f888021338e4747b8e607
```

- [snmp-server engineID local](#)
- [snmp-server engineID local reset](#)

# show snmp-server community

**Overview** This command displays the SNMP server communities configured on the device. SNMP communities are specific to v1 and v2c.

**Syntax** `show snmp-server community`

**Mode** Privileged Exec

**Example** To display the SNMP server communities, use the command:

```
awplus# show snmp-server community
```

**Output** Figure 69-5: Example output from the **show snmp-server community** command

```
SNMP community information:
Community Name public
Access Read-only
View none
```

**Related commands** [show snmp-server](#)  
[snmp-server community](#)

# show snmp-server group

**Overview** This command displays information about SNMP server groups. This command is used with SNMP version 3 only.

**Syntax** `show snmp-server group`

**Mode** Privileged Exec

**Example** To display the SNMP groups configured on the device, use the command:

```
awplus# show snmp-server group
```

**Output** Figure 69-6: Example output from the **show snmp-server group** command

```
SNMP group information:
 Group name guireadgroup
 Security Level priv

[snmp-server enable trap](#)

# show snmp-server user

**Overview** This command displays the SNMP server users and is used with SNMP version 3 only.

**Syntax** `show snmp-server user`

**Mode** Privileged Exec

**Example** To display the SNMP server users configured on the device, use the command:

```
awplus# show snmp-server user
```

**Output** Figure 69-8: Example output from the **show snmp-server user** command

Name	Group name	Auth	Privacy
freddy	guireadgroup	none	none

**Related commands** [show snmp-server](#)  
[snmp-server user](#)

# show snmp-server view

**Overview** This command displays the SNMP server views and is used with SNMP version 3 only.

**Syntax** `show snmp-server view`

**Mode** Privileged Exec

**Example** To display the SNMP server views configured on the device, use the command:

```
awplus# show snmp-server view
```

**Output** Figure 69-9: Example output from the **show snmp-server view** command

```
SNMP view information:
View Name view1
OID 1
Type included
```

**Related commands** [show snmp-server](#)  
[snmp-server view](#)

# snmp trap link-status

**Overview** Use this command to enable SNMP to send link status notifications (traps) for the interfaces when an interface goes up (linkUp) or down (linkDown).

Use the **no** variant of this command to disable the sending of link status notifications.

**Syntax** `snmp trap link-status [enterprise]`  
`no snmp trap link-status`

Parameter	Description
enterprise	Send an Allied Telesis enterprise type of link trap.

**Default** Disabled

**Mode** Interface Configuration

**Usage notes** The link status notifications can be enabled for the following interface types:

- switch port (e.g. port1.0.1)
- VLAN (e.g. vlan2)
- static and dynamic link aggregation (e.g. sa2, po2)

To specify where notifications are sent, use the [snmp-server host](#) command. To configure the device globally to send other notifications, use the [snmp-server enable trap](#) command.

**Examples** To enable SNMP to send link status notifications for port1.0.1 to port1.0.3 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status
```

To disable the sending of link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status
```

**Related commands** [show interface](#)  
[snmp trap link-status suppress](#)  
[snmp-server enable trap](#)  
[snmp-server host](#)

# snmp trap link-status suppress

**Overview** Use this command to enable the suppression of link status notifications (traps) for the interfaces beyond the specified threshold, in the specified interval.

Use the **no** variant of this command to disable the suppression of link status notifications for the ports.

**Syntax** `snmp trap link-status suppress {time {<1-60>|default}|threshold {<1-20>|default}}`

`no snmp trap link-status suppress`

Parameter	Description
time	Set the suppression timer for link status notifications.
<1-60>	The suppress time in seconds.
default	The default suppress time in seconds (60).
threshold	Set the suppression threshold for link status notifications. This is the number of link status notifications after which to suppress further notifications within the suppression timer interval.
<1-20>	The number of link status notifications.
default	The default number of link status notifications (20).

**Default** By default, if link status notifications are enabled (they are enabled by default), the suppression of link status notifications is enabled: notifications that exceed the notification threshold (default 20) within the notification timer interval (default 60 seconds) are not sent.

**Mode** Interface Configuration

**Usage notes** An unstable network can generate many link status notifications. When notification suppression is enabled, a suppression timer is started when the first link status notification of a particular type (linkUp or linkDown) is sent for an interface.

If the threshold number of notifications of this type is sent before the timer reaches the suppress time, any further notifications of this type generated for the interface during the interval are not sent. At the end of the interval, the sending of link status notifications resumes, until the threshold is reached in the next interval.

**Examples** To suppress link status notifications for port1.0.1 to port1.0.3 after 10 notifications in 40 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status suppress time 40
threshold 10
```

To stop suppressing link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status suppress
```

**Related commands**

- [show interface](#)
- [snmp trap link-status](#)

# snmp-server

**Overview** Use this command to enable the SNMP agent (server) on the device. The SNMP agent receives and processes SNMP packets sent to the device, and generates notifications (traps) that have been enabled by the [snmp-server enable trap](#) command.

Use the **no** variant of this command to disable the SNMP agent on the device. When SNMP is disabled, SNMP packets received by the device are discarded, and no notifications are generated. This does not remove any existing SNMP configuration.

**Syntax** `snmp-server [ip|ipv6]`  
`no snmp-server [ip|ipv6]`

Parameter	Description
ip	Enable or disable the SNMP agent for IPv4.
ipv6	Enable or disable the SNMP agent for IPv6.

**Default** By default, the SNMP agent is enabled for both IPv4 and IPv6. If neither the **ip** parameter nor the **ipv6** parameter is specified for this command, then SNMP is enabled or disabled for both IPv4 and IPv6.

**Mode** Global Configuration

**Examples** To enable SNMP on the device for both IPv4 and IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server
```

To enable the SNMP agent for IPv4 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server ip
```

To disable the SNMP agent for both IPv4 and IPv6 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server
```

To disable the SNMP agent for IPv4, use the commands:

```
awplus(config)# no snmp-server ipv4
```

**Related commands**

- show snmp-server community
- show snmp-server user
- snmp-server community
- snmp-server contact
- snmp-server enable trap
- snmp-server engineID local
- snmp-server group
- snmp-server host
- snmp-server location
- snmp-server view

# snmp-server community

**Overview** This command creates an SNMP community, optionally setting the access mode for the community. The default access mode is read-only. If view is not specified, the community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

The **no** variant of this command removes an SNMP community. The specified community must already exist on the device.

**Syntax** `snmp-server community <community-name> {view <view-name>|ro|rw|<access-list>}`  
`no snmp-server community <community-name>`

Parameter	Description
<community-name>	Community name. The community name is a case sensitive string of up to 20 characters.
view	Configure SNMP view. If view is not specified, the community allows access to all the MIB objects.
<view-name>	View name. The view name is a string up to 20 characters long and is case sensitive.
ro	Read-only community.
rw	Read-write community.
<access-list>	<1-99> Access list number.

**Mode** Global Configuration

**Example** Use the following commands to create an SNMP community called 'public' with read-only access to all MIB variables from any management station:

```
awplus# configure terminal
awplus(config)# snmp-server community public ro
```

Use the following commands to remove an SNMP community called 'public'

```
awplus# configure terminal
awplus(config)# no snmp-server community public
```

**Related commands** [show snmp-server](#)  
[show snmp-server community](#)  
[snmp-server view](#)

# snmp-server contact

**Overview** This command sets the contact information for the system. The contact name is:

- displayed in the output of the [show system](#) command
- stored in the MIB object sysContact

The **no** variant of this command removes the contact information from the system.

**Syntax** `snmp-server contact <contact-info>`  
`no snmp-server contact`

Parameter	Description
<code>&lt;contact-info&gt;</code>	The contact information for the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

**Mode** Global Configuration

**Example** To set the system contact information to "support@alliedtelesis.co.nz", use the command:

```
awplus# configure terminal
awplus(config)# snmp-server contact
support@alliedtelesis.co.nz
```

**Related commands** [show system](#)  
[snmp-server location](#)  
[snmp-server group](#)

# snmp-server enable trap

**Overview** Use this command to enable the switch to transmit the specified notifications (traps).

Note that the Environmental Monitoring traps defined in the AT-ENVMONv2-MIB are enabled by default.

Use the **no** variant of this command to disable the transmission of the specified notifications.

**Syntax** `snmp-server enable trap <trap-list>`  
`no snmp-server enable trap <trap-list>`

Depending on your device model, you can enable some or all of the traps in the following table:

Parameter	Description
atmf	AMF traps.
atmfguestnode	AMF guest node traps.
atmflink	AMF link traps.
atmfnode	AMF node traps.
atmfrr	AMF reboot-rolling traps.
auth	Authentication failure.
bgp	BGP traps.
chassis	Chassis traps.
cwmap	Access Point traps with the AWC wireless manager.
dhcpsnooping	DHCP snooping and ARP security traps. These notifications must also be set using the <b>ip dhcp snooping violation</b> command, and/or the arp security violation <b>arp security violation</b> command.
epsr	EPSR traps.
g8032	G.8032 ERP traps.
lldp	Link Layer Discovery Protocol (LLDP) traps. These notifications must also be enabled using the <b>lldp notifications</b> command, and/or the <b>lldp med-notifications</b> command.
loopprot	Loop Protection traps.
mstp	MSTP traps.
nsm	NSM traps.
ospf	OSPF traps.
pim	PIM traps.

Parameter	Description
power-inline	Power-inline traps (Power Ethernet MIB RFC 3621).
qsp	QoS Storm Protection
rmon	RMON traps.
thrash-limit	MAC address Thrash Limiting traps.
vcs	VCS traps.
vrrp	Virtual Router Redundancy (VRRP) traps.
ufo	Upstream Forwarding Only (UFO) traps.

**Default** Disabled

**Mode** Global Configuration

**Usage notes** This command cannot be used to enable link status notifications globally. To enable link status notifications for particular interfaces, use the [snmp trap link-status](#) command.

To specify where notifications are sent, use the [snmp-server host](#) command.

Note that you can enable (or disable) multiple traps with a single command, by specifying a space-separated list of traps.

**Examples** To enable the device to send a notification if an AMF node changes its status, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap atmfnode
```

To enable the device to send PoE related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap power-inline
```

To disable PoE traps being sent out by the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap power-inline
```

To enable the device to send MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap thrash-limit
```

To disable the device from sending MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap thrash-limit
```

To enable the device to send OSPF and VRRP-related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap ospf vrrp
```

To disable OSPF traps being sent out by the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap ospf
```

**Command  
changes**

Version 5.4.7-2.1: **ufo** parameter added  
Version 5.5.1-1.1: **atmfguestnode** and **cwmap** parameters added

# snmp-server engineID local

**Overview** Use this command to configure the SNMPv3 engine ID. The SNMPv3 engine ID is used to uniquely identify the SNMPv3 agent on a device when communicating with SNMP management clients. Once an SNMPv3 engine ID is assigned, this engine ID is permanently associated with the device until you change it.

Use the **no** variant of this command to set the user defined SNMPv3 engine ID to a system generated pseudo-random value by resetting the SNMPv3 engine. The **no snmp-server engineID local** command has the same effect as the **snmp-server engineID local default** command.

Note that the [snmp-server engineID local reset](#) command is used to force the system to generate a new engine ID when the current engine ID is also system generated.

**Syntax** `snmp-server engineID local {<engine-id>|default}`  
`no snmp-server engineID local`

Parameter	Description
<code>&lt;engine-id&gt;</code>	Specify SNMPv3 Engine ID value, a string of up to 27 characters.
<code>default</code>	Set SNMPv3 engine ID to a system generated value by resetting the SNMPv3 engine, provided the current engine ID is user defined. If the current engine ID is system generated, use the <a href="#">snmp-server engineID local reset</a> command to force the system to generate a new engine ID.

**Mode** Global Configuration

**Usage notes** All devices must have a unique engine ID which is permanently set unless it is configured by the user.

In a stacked environment, if the same engine ID was automatically generated for all members of the stack, conflicts would occur if the stack was dismantled. Therefore, each member of the stack will generate its own engine ID and the stack master's ID is used when transmitting SNMPv3 packets. Should a master failover occur, a different engine ID is transmitted. You can modify this behavior by manually assigning all stack members the same engine ID using the [snmp-server engineID local](#) command. However, should you decide to separate the stack and use the devices individually, you must remember to change or remove this configuration to prevent conflicts.

**Example** To set the SNMPv3 engine ID to 800000cf030000cd123456, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local
800000cf030000cd123456
```

To set a user defined SNMPv3 engine ID back to a system generated value, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server engineID local
```

**Output** The following example shows the engine ID values after configuration:

```
awplus(config)#snmp-server engineid local asdgdfh231234d
awplus(config)#exit
awplus#show snmp-server

SNMP Server Enabled
IP Protocol IPv4
SNMPv3 Engine ID (configured name) ... asdgdfh231234d
SNMPv3 Engine ID (actual) 0x80001f888029af52e149198483

awplus(config)#no snmp-server engineid local
awplus(config)#exit
awplus#show snmp-server

SNMP Server Enabled
IP Protocol IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) 0x80001f888029af52e149198483
```

**Related commands** [show snmp-server](#)  
[snmp-server engineID local reset](#)  
[snmp-server group](#)

# snmp-server engineID local reset

**Overview** Use this command to force the device to generate a new pseudo-random SNMPv3 engine ID by resetting the SNMPv3 engine. If the current engine ID is user defined, use the [snmp-server engineID local](#) command to set SNMPv3 engine ID to a system generated value.

**Syntax** `snmp-server engineID local reset`

**Mode** Global Configuration

**Example** To force the SNMPv3 engine ID to be reset to a system generated value, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local reset
```

**Related commands** [snmp-server engineID local](#)  
[show snmp-server](#)

# snmp-server group

**Overview** This command is used with SNMP version 3 only, and adds an SNMP group, optionally setting the security level and view access modes for the group. The security and access views defined for the group represent the minimum required of its users in order to gain access.

The **no** variant of this command deletes an SNMP group, and is used with SNMPv3 only. The group with the specified authentication/encryption parameters must already exist.

**Syntax** `snmp-server group <groupname> {auth|noauth|priv} [read <readname>|write <writename>|notify <notifyname>]`  
`no snmp-server group <groupname>`

Parameter	Description
<groupname>	Group name. The group name is a string up to 20 characters long and is case sensitive.
auth	Authentication.
noauth	No authentication and no encryption.
priv	Authentication and encryption.
read	Configure read view.
<readname>	Read view name.
write	Configure write view.
<writename>	Write view name. The view name is a string up to 20 characters long and is case sensitive.
notify	Configure notify view.
<notifyname>	Notify view name. The view name is a string up to 20 characters long and is case sensitive.

**Mode** Global Configuration

**Examples** To add SNMP group, for ordinary users, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server group usergroup noauth read
useraccess write useraccess
```

To delete the SNMP group called 'usergroup', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server group usergroup
```

**Related  
commands**

- snmp-server
- show snmp-server
- show snmp-server group
- show snmp-server user

# snmp-server host

**Overview** This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6),
- inform or trap messages,
- community name (SNMPv1 or SNMP v2c) or the authentication/encryption parameters and user name (SNMP v3).

**Syntax**

```
snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>]

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>

no snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>
```

Parameter	Description
<ipv4-address>	IPv4 trap host address in the format A . B . C . D, for example, 192.0.2.2.
<ipv6-address>	IPv6 trap host address in the format x : x : : x : x for example, 2001:db8::8a2e:7334.
informs	Send Inform messages to this host.
traps	Send Trap messages to this host (default).
version	SNMP version to use for notification messages. Default: version 1.
1	Use SNMPv1 (default).
2c	Use SNMPv2c.
3	Use SNMPv3.

Parameter	Description
auth	Authentication.
noauth	No authentication.
priv	Encryption.
<community-name>	The SNMPv1 or SNMPv2c community name.
<user-name>	SNMPv3 user name.

**Mode** Global Configuration

**Examples** To configure the device to send generated traps to the IPv4 host destination 192.0.2.5 with the SNMPv2c community name public, use the following command:

```
awplus# configure terminal
awplus(config)# snmp-server host version 2c public192.0.2.5
```

To configure the device to send generated traps to the IPv6 host destination 2001:db8::8a2e:7334 with the SNMPv2c community name private, use the following command:

```
awplus# configure terminal
awplus(config)# snmp-server host version 2c
private2001:db8::8a2e:7334
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name public, use the following command:

```
awplus# configure terminal
awplus(config)# no snmp-server host version 2c public192.0.2.5
```

**Related commands**

- [snmp trap link-status](#)
- [snmp-server enable trap](#)
- [snmp-server view](#)

# snmp-server legacy-ifadminstatus

**Overview** Use this command to set the ifAdminStatus to reflect the operational state of the interface, rather than the administrative state.

The **no** variant of this command sets the ifAdminStatus to reflect the administrative state of the interface.

**Syntax** `snmp-server legacy-ifadminstatus`  
`no snmp-server legacy-ifadminstatus`

**Default** Legacy ifAdminStatus is turned off by default, so by default the SNMP ifAdminStatus reflects the administrative state of the interface.

**Mode** Global Configuration

**Usage notes** Note that if you enable Legacy ifAdminStatus, the ifAdminStatus will report a link's status as Down when the link has been blocked by a process such as loop protection.

**Example** To turn on Legacy ifAdminStatus, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server legacy-ifadminstatus
```

**Related commands** [show interface](#)

# snmp-server location

**Overview** This command sets the location of the system. The location is:

- displayed in the output of the [show system](#) command
- stored in the MIB object sysLocation

The **no** variant of this command removes the configured location from the system.

**Syntax** `snmp-server location <location-name>`  
`no snmp-server location`

Parameter	Description
<code>&lt;location-name&gt;</code>	The location of the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

**Mode** Global Configuration

**Example** To set the location to “server room 523”, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server location server room 523
```

**Related commands** [show snmp-server](#)  
[show system](#)  
[snmp-server contact](#)

# snmp-server source-interface

**Overview** Use this command to specify the originating interface for SNMP traps or informs. An interface specified by this command must already have an IP address assigned to it.

Use the **no** variant of this command to reset the interface to its default value (the originating egress interface).

**Syntax** `snmp-server source-interface {traps|informs} <interface-name>`  
`no snmp-server source-interface {traps|informs}`

Parameter	Description
traps	SNMP traps.
informs	SNMP informs.
<interface-name>	Interface name (must already have an IP address assigned).

**Default** The originating egress interface of the traps and informs messages

**Mode** Global Configuration

**Usage notes** When an SNMP server sends an SNMP trap or inform message, the message carries the notification IP address of its originating interface. Use this command to assign this interface.

**Example** The following commands set vlan2 to be the interface whose IP address is used as the originating address in SNMP informs packets.

```
awplus# configure terminal
awplus(config)# snmp-server source-interface informs vlan2
```

The following commands reset the originating source interface for SNMP trap messages to be the default interface (the originating egress interface):

```
awplus# configure terminal
awplus(config)# no snmp-server source-interface traps
```

**Validation Commands** [show running-config](#)

# snmp-server startup-trap-delay

**Overview** Use this command to set the time in seconds after following completion of the device startup sequence before the device sends any SNMP traps (or SNMP notifications).

Use the no variant of this command to restore the default startup delay of 30 seconds.

**Syntax** `snmp-server startup-trap-delay <delay-time>`  
`no snmp-server startup-trap-delay`

Parameter	Description
<code>&lt;delay-time&gt;</code>	Specify an SNMP trap delay time in seconds in the range of 30 to 600 seconds.

**Default** The SNMP server trap delay time is 30 seconds. The no variant restores the default.

**Mode** Global Configuration

**Example** To delay the device sending SNMP traps until 60 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server startup-trap-delay 60
```

To restore the sending of SNMP traps to the default of 30 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server startup-trap-delay
```

**Validation Commands** `show snmp-server`

## snmp-server user

**Overview** Use this command to create or move users as members of specified groups. This command is used with SNMPv3 only.

The **no** variant of this command removes an SNMPv3 user. The specified user must already exist.

**Syntax** `snmp-server user <username> <groupname> [encrypted] [auth {md5|sha|sha-256} <auth-password>] [priv {des|aes} <privacy-password>]`  
`no snmp-server user <username>`

Parameter	Description
<username>	User name. The user name is a string up to 20 characters long and is case sensitive.
<groupname>	Group name. The group name is a string up to 20 characters long and is case sensitive.
encrypted	Use the encrypted parameter when you want to enter encrypted passwords.
auth	Authentication protocol.
md5	MD5 Message Digest Algorithms.
sha	SHA Secure Hash Algorithm.
sha-256	SHA-256 Secure Hash Algorithm. Note: SHA-256 authentication is required in <code>crypto secure-mode</code> .
<auth-password>	Authentication password. The password is a string of 8 to 20 characters long and is case sensitive.
priv	Privacy protocol.
des	DES: Data Encryption Standard. DES is not available if you enable <code>crypto secure-mode</code> .
aes	AES: Advanced Encryption Standards.
<privacy-password>	Privacy password. The password is a string of 8 to 20 characters long and is case sensitive.

**Mode** Global Configuration

**Usage notes** Additionally this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

- Note that each SNMP user must be configured on both the manager and agent entities. Where passwords are used, these passwords must be the same for both entities.

- Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configs stored on the device. For example, you may need to move a user from one group to another group and keep the same passwords for the user instead of removing the user to apply new passwords.
- User passwords are entered using plaintext without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.
- User passwords are viewed as encrypted passwords in running and startup configs shown from **show running-config** and **show startup-config** commands respectively. Copy and paste encrypted passwords from running-configs or startup-configs to avoid entry errors.

**Examples** To add SNMP user authuser as a member of group 'usergroup', with authentication protocol MD5, authentication password 'Authpass', privacy protocol AES and privacy password 'Privpass' use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser usergroup auth md5
Authpass priv aes Privpass
```

Validate the user is assigned to the group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name Group name Auth Privacy
----- -
authuser usergroup md5 aes
```

To enter existing SNMP user 'authuser' with existing passwords as a member of group 'newusergroup' with authentication protocol MD5 with the encrypted authentication password 0x1c74b9c22118291b0ce0cd883f8dab6b74, and privacy protocol AES with the encrypted privacy password 0x0e0133db5453ebd03822b004eeacb6608f, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser newusergroup
encrypted auth md5 0x1c74b9c22118291b0ce0cd883f8dab6b74 priv
aes 0x0e0133db5453ebd03822b004eeacb6608f
```

**NOTE:** Copy and paste the encrypted passwords from the **running-config** or the **startup-config** displayed, using the **show running-config** and **show startup-config** commands respectively, into the command line to avoid key stroke errors issuing this command.

Validate the user has been moved from the first group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name Group name Auth Privacy

authuser newusergroup md5 aes
```

To delete SNMP user 'authuser', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server user authuser
```

**Related commands**

- [show snmp-server user](#)
- [snmp-server view](#)

# snmp-server view

**Overview** Use this command to create an SNMP view that specifies a sub-tree of the MIB. Further sub-trees can then be added by specifying a new OID to an existing view. Views can be used in SNMP communities or groups to control the remote manager's access.

**NOTE:** The object identifier must be specified in a sequence of integers separated by decimal points.

The **no** variant of this command removes the specified view on the device. The view must already exist.

**Syntax** `snmp-server view <view-name> <mib-name> {included|excluded}`  
`no snmp-server view <view-name>`

Parameter	Description
<view-name>	SNMP server view name. The view name is a string up to 20 characters long and is case sensitive.
<mib-name>	Object identifier of the MIB.
included	Include this OID in the view.
excluded	Exclude this OID in the view.

**Mode** Global Configuration

**Examples** The following command creates a view called "loc" that includes the system location MIB sub-tree.

```
awplus(config)# snmp-server view loc 1.3.6.1.2.1.1.6.0 included
```

To remove the view "loc" use the following command

```
awplus(config)# no snmp-server view loc
```

# undebbug snmp

**Overview** This command applies the functionality of the no `debug snmp` command.

# 70

# LLDP Commands

## Introduction

**Overview** LLDP and LLDP-MED can be configured using the commands in this chapter, or by using SNMP with the LLDP-MIB and LLDP-EXT-DOT1-MIB (see the [Support for Allied Telesis Enterprise MIBs in AlliedWare Plus](#)).

The Voice VLAN feature can be configured using commands in [VLAN Commands](#) chapter.

For more information about LLDP, see the [LLDP Feature Overview and Configuration Guide](#).

LLDP can transmit a lot of data about the network. Typically, the network information gathered using LLDP is transferred to a Network Management System by SNMP. For security reasons, we recommend using SNMPv3 for this purpose (see the [SNMP Feature Overview and Configuration Guide](#)).

LLDP operates over physical ports only. For example, it can be configured on switch ports that belong to static or dynamic channel groups, but not on the channel groups themselves.

# clear lldp statistics

**Overview** This command clears all LLDP statistics (packet and event counters) associated with specified ports. If no port list is supplied, LLDP statistics for all ports are cleared.

**Syntax** `clear lldp statistics [interface <port-list>]`

Parameter	Description
<port-list>	The ports for which the statistics are to be cleared.

**Mode** Privileged Exec

**Examples** To clear the LLDP statistics on ports 1.0.1 and 1.0.6, use the command:

```
awplus# clear lldp statistics interface port1.0.1,port1.0.6
```

To clear all LLDP statistics for all ports, use the command:

```
awplus# clear lldp statistics
```

**Related commands** [show lldp statistics](#)  
[show lldp statistics interface](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# clear lldp table

**Overview** This command clears the table of LLDP information received from neighbors through specified ports. If no port list is supplied, neighbor information is cleared for all ports.

**Syntax** `clear lldp table [interface <port-list>]`

Parameter	Description
<code>&lt;port-list&gt;</code>	The ports for which the neighbor information table is to be cleared.

**Mode** Privileged Exec

**Examples** To clear the table of neighbor information received on ports 1.0.1 and 1.0.6, use the command:

```
awplus# clear lldp table interface port1.0.1,port1.0.6
```

To clear the entire table of neighbor information received through all ports, use the command:

```
awplus# clear lldp table
```

**Related commands** [show lldp neighbors](#)

# debug lldp

**Overview** This command enables specific LLDP debug for specified ports. When LLDP debugging is enabled, diagnostic messages are entered into the system log. If no port list is supplied, the specified debugging is enabled for all ports.

The **no** variant of this command disables specific LLDP debug for specified ports. If no port list is supplied, the specified debugging is disabled for all ports.

**Syntax**

```
debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]
debug lldp operation
no debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]
no debug lldp operation
no debug lldp all
```

Parameter	Description
rx	LLDP receive debug.
rxpkt	Raw LLDPDUs received in hex format.
tx	LLDP transmit debug.
txpkt	Raw Tx LLDPDUs transmitted in hex format.
<port-list>	The ports for which debug is to be configured.
operation	Debug for LLDP internal operation on the switch.
all	Disables all LLDP debugging for all ports.

**Default** By default no debug is enabled for any ports.

**Mode** Privileged Exec

**Examples** To enable debugging of LLDP receive on ports 1.0.1 and 1.0.6, use the command:

```
awplus# debug lldp rx interface port1.0.1,port1.0.6
```

To enable debugging of LLDP transmit with packet dump on all ports, use the command:

```
awplus# debug lldp tx txpkt
```

To disable debugging of LLDP receive on ports 1.0.1 and 1.0.6, use the command:

```
awplus# no debug lldp rx interface port1.0.1,port1.0.6
```

To turn off all LLDP debugging on all ports, use the command:

```
awplus# no debug lldp all
```

**Related commands** show debugging lldp  
show running-config lldp  
terminal monitor

# lldp faststart-count

**Overview** Use this command to set the fast start count for LLDP-MED. The fast start count determines how many fast start advertisements LLDP sends from a port when it starts sending LLDP-MED advertisements from the port, for instance, when it detects a new LLDP-MED capable device.

The **no** variant of this command resets the LLDP-MED fast start count to the default (3).

**Syntax** `lldp faststart-count <1-10>`  
`no lldp faststart-count`

Parameter	Description
<1-10>	The number of fast start advertisements to send.

**Default** The default fast start count is 3.

**Mode** Global Configuration

**Examples** To set the fast start count to 5, use the command:

```
awplus# configure terminal
awplus(config)# lldp faststart-count 5
```

To reset the fast start count to the default setting (3), use the command:

```
awplus# configure terminal
awplus(config)# no lldp faststart-count
```

**Related commands** [show lldp](#)

# Ildp holdtime-multiplier

**Overview** This command sets the holdtime multiplier value. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors.

The **no** variant of this command sets the multiplier back to its default.

**Syntax** `lldp holdtime-multiplier <2-10>`  
`no lldp holdtime-multiplier`

Parameter	Description
<2-10>	The multiplier factor.

**Default** The default holdtime multiplier value is 4.

**Mode** Global Configuration

**Usage** The Time-To-Live defines the period for which the information advertised to the neighbor is valid. If the Time-To-Live expires before the neighbor receives another update of the information, then the neighbor discards the information from its database.

**Examples** To set the holdtime multiplier to 2, use the commands:

```
awplus# configure terminal
awplus(config)# lldp holdtime-multiplier 2
```

To set the holdtime multiplier back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp holdtime-multiplier 2
```

**Related commands** [show lldp](#)

# lldp management-address

**Overview** This command sets the IPv4 address to be advertised to neighbors (in the Management Address TLV) via the specified ports. This address will override the default address for these ports.

The **no** variant of this command clears the user-configured management IP address advertised to neighbors via the specified ports. The advertised address reverts to the default.

**Syntax** `lldp management-address <ipaddr>`  
`no lldp management-address`

Parameter	Description
<code>&lt;ipaddr&gt;</code>	The IPv4 address to be advertised to neighbors, in dotted decimal format. This must be one of the IP addresses already configured on the device.

**Default** The local loopback interface primary IPv4 address if set, else the primary IPv4 interface address of the lowest numbered VLAN the port belongs to, else the MAC address of the device's baseboard if no VLAN IP addresses are configured for the port.

**Mode** Interface Configuration

**Usage notes** To see the management address that will be advertised, use the [show lldp interface](#) command or [show lldp local-info](#) command.

**Examples** To set the management address advertised by port1.0.1 and port1.0.2, to be 192.168.1.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp management-address 192.168.1.6
```

To clear the user-configured management address advertised by port1.0.1 and port1.0.2, and revert to using the default address, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp management-address
```

**Related commands** [show lldp interface](#)  
[show lldp local-info](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp med-notifications

**Overview** Use this command to enable LLDP to send LLDP-MED Topology Change Detected SNMP notifications relating to the specified ports. The switch sends an SNMP event notification when a new LLDP-MED compliant IP Telephony device is connected to or disconnected from a port on the switch.

Use the **no** variant of this command to disable the sending of LLDP-MED Topology Change Detected notifications relating to the specified ports.

**Syntax** `lldp med-notifications`  
`no lldp med-notifications`

**Default** The sending of LLDP-MED notifications is disabled by default.

**Mode** Interface Configuration

**Examples** To enable the sending of LLDP-MED Topology Change Detected notifications relating to ports port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-notifications
```

To disable the sending of LLDP-MED notifications relating to port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-notifications
```

**Related commands** [lldp notification-interval](#)  
[lldp notifications](#)  
[snmp-server enable trap](#)  
[show lldp interface](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp med-tlv-select

**Overview** Use this command to enable LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via the specified ports. The LLDP-MED Capabilities TLV must be enabled before any of the other LLDP-MED Organizationally Specific TLVs are enabled.

Use the **no** variant of this command to disable the specified LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via these ports. In order to disable the LLDP-MED Capabilities TLV, you must also disable the rest of these TLVs. Disabling all these TLVs disables LLDP-MED advertisements.

**Syntax**

```
lldp med-tlv-select [capabilities] [network-policy] [location]
[power-management-ext] [inventory-management]

lldp med-tlv-select all

no lldp med-tlv-select [capabilities] [network-policy]
[location] [power-management-ext] [inventory-management]

no lldp med-tlv-select all
```

Parameter	Description
capabilities	LLDP-MED Capabilities TLV. When this is enabled, the MAC/PHY Configuration/Status TLV from IEEE 802.3 Organizationally Specific TLVs is also automatically included in LLDP-MED advertisements, whether or not it has been explicitly enabled by the <code>lldp tlv-select</code> command.
network-policy	Network Policy TLV. This TLV is transmitted if Voice VLAN parameters have been configured using the commands: <ul style="list-style-type: none"><li><code>switchport voice dscp</code></li><li><code>switchport voice vlan</code></li><li><code>switchport voice vlan priority</code></li></ul>
location	Location Identification TLV. This TLV is transmitted if location information has been configured using the commands: <ul style="list-style-type: none"><li><code>location elin-location-id</code></li><li><code>location civic-location identifier</code></li><li><code>location civic-location configuration</code></li><li><code>location coord-location identifier</code></li><li><code>location coord-location configuration</code></li><li><code>location elin-location</code></li></ul>
power-management-ext	Extended Power-via-MDI TLV. This TLV is transmitted if the port is PoE capable, and PoE is enabled ( <code>power-inline enable</code> command).

Parameter	Description
inventory-management	Inventory Management TLV Set, including the following TLVs: <ul style="list-style-type: none"> <li>• Hardware Revision</li> <li>• Firmware Revision</li> <li>• Software Revision</li> <li>• Serial Number</li> <li>• Manufacturer Name</li> <li>• Model Name</li> <li>• Asset ID</li> </ul>
all	All LLDP-MED Organizationally Specific TLVs.

**Default** By default LLDP-MED Capabilities, Network Policy, Location Identification and Extended Power-via-MDI TLVs are enabled. Therefore, if LLDP is enabled using the `lldp run` command, by default LLDP-MED advertisements are transmitted on ports that detect LLDP-MED neighbors connected to them.

**Mode** Interface Configuration

**Usage notes** LLDP-MED TLVs are only sent in advertisements via a port if there is an LLDP-MED-capable device connected to it. To see whether there are LLDP-MED capable devices connected to the ports, use the `show lldp neighbors` command.

**Examples** To enable inclusion of the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-tlv-select inventory-management
```

To exclude the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select inventory-management
```

To disable LLDP-MED advertisements transmitted via port1.0.1 and port1.0.2, disable all these TLVs using the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select all
```

**Related commands**

- lldp tlv-select
- location elin-location-id
- location civic-location identifier
- location civic-location configuration
- location coord-location identifier
- location coord-location configuration
- location elin-location
- show lldp interface
- switchport voice dscp
- switchport voice vlan
- switchport voice vlan priority

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp non-strict-med-tlv-order-check

**Overview** Use this command to enable non-strict order checking for LLDP-MED advertisements it receives. That is, use this command to enable LLDP to receive and store TLVs from LLDP-MED advertisements even if they do not use standard TLV order.

Use the **no** variant of this command to disable non-strict order checking for LLDP-MED advertisements, that is, to set strict TLV order checking, so that LLDP discards any LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement.

**Syntax** `lldp non-strict-med-tlv-order-check`  
`no lldp non-strict-med-tlv-order-check`

**Default** By default TLV non-strict order checking for LLDP-MED advertisements is disabled. That is, strict order checking is applied to LLDP-MED advertisements, according to ANSI/TIA-1057, and LLDP-MED TLVs in non-standard order are discarded.

**Mode** Global Configuration

**Usage notes** The ANSI/TIA-1057 specifies standard order for TLVs in LLDP-MED advertisements, and specifies that if LLDP receives LLDP advertisements with non-standard LLDP-MED TLV order, the TLVs in non-standard order should be discarded. This implementation of LLDP-MED follows the standard: it transmits TLVs in the standard order, and by default discards LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement. However, some implementations of LLDP transmit LLDP-MED advertisements with non-standard TLV order. To receive and store the data from these non-standard advertisements, enable non-strict order checking for LLDP-MED advertisements using this command.

**Examples** To enable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tlv-order-check
```

To disable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tlv-order-check
```

**Related commands** [show running-config lldp](#)

# lldp notification-interval

**Overview** This command sets the notification interval. This is the minimum interval between LLDP SNMP notifications (traps) of each kind (LLDP Remote Tables Change Notification and LLDP-MED Topology Change Notification).

The **no** variant of this command sets the notification interval back to its default.

**Syntax** `lldp notification-interval <5-3600>`  
`no lldp notification-interval`

Parameter	Description
<5-3600>	The interval in seconds.

**Default** The default notification interval is 5 seconds.

**Mode** Global Configuration

**Examples** To set the notification interval to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp notification-interval 20
```

To set the notification interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp notification-interval
```

**Related commands** [lldp notifications](#)  
[show lldp](#)

# lldp notifications

**Overview** This command enables the sending of LLDP SNMP notifications (traps) relating to specified ports.

The **no** variant of this command disables the sending of LLDP SNMP notifications for specified ports.

**Syntax** `lldp notifications`  
`no lldp notifications`

**Default** The sending of LLDP SNMP notifications is disabled by default.

**Mode** Interface Configuration

**Examples** To enable sending of LLDP SNMP notifications for ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# lldp notifications
```

To disable sending of LLDP SNMP notifications for ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# no lldp notifications
```

**Related commands** [lldp notification-interval](#)  
[show lldp interface](#)  
[snmp-server enable trap](#)

# lldp port-number-type

**Overview** This command sets the type of port identifier used to enumerate, that is to count, the LLDP MIB local port entries. The LLDP MIB (IEEE Standard 802.1AB-2005, Section 12, LLDP MIB Definitions.) requires the port number value to count LLDP local port entries.

This command also enables you to optionally set an interface index to enumerate the LLDP MIB local port entries, if required by your management system.

The **no** variant of this command resets the type of port identifier back to the default setting (number).

**Syntax** `lldp port-number-type [number|ifindex]`  
`no lldp port-number-type`

Parameter	Description
number	Set the type of port identifier to a port number to enumerate the LLDP MIB local port entries.
ifindex	Set the type of port identifier to an interface index to enumerate the LLDP MIB local port entries.

**Default** The default port identifier type is number. The no variant of this command sets the port identifier type to the default.

**Mode** Global Configuration

**Examples** To set the type of port identifier used to enumerate LLDP MIB local port entries to port numbers, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type number
```

To set the type of port identifier used to enumerate LLDP MIB local port entries to interface indexes, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type ifindex
```

To reset the type of port identifier used to enumerate LLDP MIB local port entries the default (port numbers), use the commands:

```
awplus# configure terminal
awplus(config)# no lldp port-number-type
```

**Related commands** [show lldp](#)

# Ildp reinit

**Overview** This command sets the value of the reinitialization delay. This is the minimum time after disabling LLDP on a port before it can reinitialize.

The **no** variant of this command sets the reinitialization delay back to its default setting.

**Syntax** `lldp reinit <1-10>`  
`no lldp reinit`

Parameter	Description
<1-10>	The delay in seconds.

**Default** The default reinitialization delay is 2 seconds.

**Mode** Global Configuration

**Examples** To set the reinitialization delay to 3 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp reinit 3
```

To set the reinitialization delay back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp reinit
```

**Related commands** [show lldp](#)

# lldp run

**Overview** This command enables the operation of LLDP on the device.  
The **no** variant of this command disables the operation of LLDP on the device. The LLDP configuration remains unchanged.

**Syntax** lldp run  
no lldp run

**Default** LLDP is disabled by default.

**Mode** Global Configuration

**Examples** To enable LLDP operation, use the commands:

```
awplus# configure terminal
awplus(config)# lldp run
```

To disable LLDP operation, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp run
```

**Related commands** [show lldp](#)

# Ildp timer

**Overview** This command sets the value of the transmit interval. This is the interval between regular transmissions of LLDP advertisements.

The **no** variant of this command sets the transmit interval back to its default.

**Syntax** `lldp timer <5-32768>`  
`no lldp timer`

Parameter	Description
<code>&lt;5-32768&gt;</code>	The transmit interval in seconds. The transmit interval must be at least four times the transmission delay timer ( <a href="#">lldp tx-delay</a> command).

**Default** The default transmit interval is 30 seconds.

**Mode** Global Configuration

**Examples** To set the transmit interval to 90 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp timer 90
```

To set the transmit interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp timer
```

**Related commands** [lldp tx-delay](#)  
[show lldp](#)

# lldp tlv-select

**Overview** This command enables one or more optional TLVs, or all TLVs, for transmission in LLDP advertisements via the specified ports. The TLVs can be specified in any order; they are placed in LLDP frames in a fixed order (as described in IEEE 802.1AB). The mandatory TLVs (Chassis ID, Port ID, Time To Live, End of LLDPDU) are always included in LLDP advertisements.

In LLDP-MED advertisements the MAC/PHY Configuration/Status TLV will be always be included regardless of whether it is selected by this command.

The **no** variant of this command disables the specified optional TLVs, or all optional TLVs, for transmission in LLDP advertisements via the specified ports.

**Syntax**

```
lldp tlv-select {[<tlv>]...}
lldp tlv-select all
no lldp tlv-select {[<tlv>]...}
no lldp tlv-select all
```

Parameter	Description
<tlv>	The TLV to transmit in LLDP advertisements. One of these keywords: <ul style="list-style-type: none"> <li>port-description (specified by the <a href="#">description (interface)</a> command)</li> <li>system-name (specified by the <a href="#">hostname</a> command)</li> <li>system-description</li> <li>system-capabilities</li> <li>management-address</li> <li>port-vlan</li> <li>port-and-protocol-vlans</li> <li>vlan-names</li> <li>protocol-ids</li> <li>mac-phy-config</li> <li>power-management (Power Via MDI TLV)</li> <li>link-aggregation</li> <li>max-frame-size</li> </ul>
all	All TLVs.

**Default** By default no optional TLVs are included in LLDP advertisements. The MAC/PHY Configuration/Status TLV ( **mac-phy-config**) is included in LLDP-MED advertisements whether or not it is selected by this command.

**Mode** Interface Configuration

**Examples** To include the management-address and system-name TLVs in advertisements transmitted via ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# lldp tlv-select management-address
system-name
```

To include all optional TLVs in advertisements transmitted via ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# lldp tlv-select all
```

To exclude the management-address and system-name TLVs from advertisements transmitted via ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# no lldp tlv-select management-address
system-name
```

To exclude all optional TLVs from advertisements transmitted via ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# no lldp tlv-select all
```

**Related commands**

# lldp transmit receive

**Overview** This command enables transmission and/or reception of LLDP advertisements to or from neighbors through the specified ports.

The **no** variant of this command disables transmission and/or reception of LLDP advertisements through specified ports.

**Syntax** `lldp {[transmit] [receive]}`  
`no lldp {[transmit] [receive]}`

Parameter	Description
transmit	Enable or disable transmission of LLDP advertisements via this port or ports.
receive	Enable or disable reception of LLDP advertisements via this port or ports.

**Default** LLDP advertisement transmission and reception are enabled on all ports by default.

**Mode** Interface Configuration

**Examples** To enable transmission of LLDP advertisements on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit
```

To enable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit receive
```

To disable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp transmit receive
```

**Related commands** [show lldp interface](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp tx-delay

**Overview** This command sets the value of the transmission delay timer. This is the minimum time interval between transmitting LLDP advertisements due to a change in LLDP local information.

The **no** variant of this command sets the transmission delay timer back to its default setting.

**Syntax** `lldp tx-delay <1-8192>`  
`no lldp tx-delay`

Parameter	Description
<code>&lt;1-8192&gt;</code>	The transmission delay in seconds. The transmission delay cannot be greater than a quarter of the transmit interval ( <a href="#">lldp timer</a> command).

**Default** The default transmission delay timer is 2 seconds.

**Mode** Global Configuration

**Examples** To set the transmission delay timer to 12 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tx-delay 12
```

To set the transmission delay timer back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tx-delay
```

**Related commands** [lldp timer](#)  
[show lldp](#)

# location civic-location configuration

**Overview** Use these commands to configure a civic address location. The country parameter must be specified first, and at least one of the other parameters must be configured before the location can be assigned to a port.

Use the **no** variants of this command to delete civic address parameters from the location.

**Syntax**

```
country <country>
state <state>
no state
county <county>
no county
city <city>
no city
division <division>
no division
neighborhood <neighborhood>
no neighborhood
street-group <street-group>
no street-group
leading-street-direction <leading-street-direction>
no leading-street-direction
trailing-street-suffix <trailing-street-suffix>
no trailing-street-suffix
street-suffix <street-suffix>
no street-suffix
house-number <house-number>
no house-number
house-number-suffix <house-number-suffix>
no house-number-suffix
landmark <landmark>
no landmark
additional-information <additional-information>
no additional-information
```

**Syntax (cont.)** name <name>  
no name  
postalcode <postalcode>  
no postalcode  
building <building>  
no building  
unit <unit>  
no unit  
floor <floor>  
no floor  
room <room>  
no room  
place-type <place-type>  
no place-type  
postal-community-name <postal-community-name>  
no postal-community-name  
post-office-box <post-office-box>  
no post-office-box  
additional-code <additional-code>  
no additional-code  
seat <seat>  
no seat  
primary-road-name <primary-road-name>  
no primary-road-name  
road-section <road-section>  
no road-section  
branch-road-name <branch-road-name>  
no branch-road-name  
sub-branch-road-name <sub-branch-road-name>  
no sub-branch-road-name  
street-name-pre-modifier <street-name-pre-modifier>  
no street-name-pre-modifier  
streetname-post-modifier <streetname-post-modifier>  
no streetname-post-modifier

Parameter	Description
<code>&lt;country&gt;</code>	Upper-case two-letter country code, as specified in ISO 3166.
<code>&lt;state&gt;</code>	State (Civic Address (CA) Type 1): national subdivisions (state, canton, region).
<code>&lt;county&gt;</code>	County (CA Type 2): County, parish, gun (JP), district (IN).
<code>&lt;city&gt;</code>	City (CA Type 3): city, township, shi (JP).
<code>&lt;division&gt;</code>	City division (CA Type 4): City division, borough, city district, ward, chou (JP).
<code>&lt;neighborhood&gt;</code>	Neighborhood (CA Type 5): neighborhood, block.
<code>&lt;street-group&gt;</code>	Street group (CA Type 6): group of streets below the neighborhood level.
<code>&lt;leading-street-direction&gt;</code>	Leading street direction (CA Type 16).
<code>&lt;trailing-street-suffix&gt;</code>	Trailing street suffix (CA Type 17).
<code>&lt;street-suffix&gt;</code>	Street suffix (CA Type 18): street suffix or type.
<code>&lt;house-number&gt;</code>	House number (CA Type 19).
<code>&lt;house-number-suffix&gt;</code>	House number suffix (CA Type 20).
<code>&lt;landmark&gt;</code>	Landmark or vanity address (CA Type 21).
<code>&lt;additional-information&gt;</code>	Additional location information (CA Type 22).
<code>&lt;name&gt;</code>	Name (CA Type 23): residence and office occupant.
<code>&lt;postal-code&gt;</code>	Postal/zip code (CA Type 24).
<code>&lt;building&gt;</code>	Building (CA Type 25): structure.
<code>&lt;unit&gt;</code>	Unit (CA Type 26): apartment, suite.
<code>&lt;floor&gt;</code>	Floor (CA Type 27).
<code>&lt;room&gt;</code>	Room (CA Type 28).
<code>&lt;place-type&gt;</code>	Type of place (CA Type 29).
<code>&lt;postal-community-name&gt;</code>	Postal community name (CA Type 30).
<code>&lt;post-office-box&gt;</code>	Post office box (P.O. Box) (CA Type 31).
<code>&lt;additional-code&gt;</code>	Additional code (CA Type 32).
<code>&lt;seat&gt;</code>	Seat (CA Type 33): seat (desk, cubicle, workstation).
<code>&lt;primary-road-name&gt;</code>	Primary road name (CA Type 34).
<code>&lt;road-section&gt;</code>	Road section (CA Type 35).

Parameter	Description
<code>&lt;branch-road-name&gt;</code>	Branch road name (CA Type 36).
<code>&lt;sub-branch-road-name&gt;</code>	Sub-branch road name (CA Type 37).
<code>&lt;street-name-pre-modifier&gt;</code>	Street name pre-modifier (CA Type 38).
<code>&lt;street-name-post-modifier&gt;</code>	Street name post-modifier (CA Type 39).

**Default** By default no civic address location information is configured.

**Mode** Civic Address Location Configuration

**Usage notes** The **country** parameter must be configured before any other parameters can be configured; this creates the location. The country parameter cannot be deleted. One or more of the other parameters must be configured before the location can be assigned to a port. The country parameter must be entered as an upper-case two-letter country code, as specified in ISO 3166. All other parameters are entered as alpha-numeric strings. Do not configure all the civic address parameters (this would generate TLVs that are too long). Configure a subset of these parameters—enough to consistently and precisely identify the location of the device. If the location is to be used for Emergency Call Service (ECS), the particular ECS application may have guidelines for configuring the civic address location. For more information about civic address format, see the [LLDP Feature Overview and Configuration Guide](#).

To specify the civic address location, use the [location civic-location identifier](#) command. To delete the civic address location, use the **no** variant of the **location civic-location identifier** command. To assign the civic address location to particular ports, so that it can be advertised in TLVs from those ports, use the command [location civic-location-id](#) command.

**Examples** To configure civic address location 1 with location "27 Nazareth Avenue, Christchurch, New Zealand" in civic-address format, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)# country NZ
awplus(config-civic)# city Christchurch
awplus(config-civic)# primary-road-name Nazareth
awplus(config-civic)# street-suffix Avenue
awplus(config-civic)# house-number 27
```

**Related commands**

- [location civic-location identifier](#)
- [show lldp local-info](#)
- [show location](#)

# location civic-location identifier

**Overview** Use this command to enter the Civic Address Location Configuration mode to configure the specified location.

Use the **no** variant of this command to delete a civic address location. This also removes the location from any ports it has been assigned to.

**Syntax** `location civic-location identifier <civic-loc-id>`  
`no location civic-location identifier <civic-loc-id>`

Parameter	Description
<code>&lt;civic-loc-id&gt;</code>	A unique civic address location ID, in the range 1 to 4095.

**Default** By default there are no civic address locations.

**Mode** Global Configuration

**Usage notes** To configure the location information for this civic address location identifier, use the [location civic-location configuration](#) command. To associate this civic location identifier with particular ports, use the [location elin-location-id](#) command.

Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

**Examples** To enter Civic Address Location Configuration mode for the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)#
```

To delete the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location civic-location identifier 1
```

**Related commands**

- [location civic-location-id](#)
- [location civic-location configuration](#)
- [show location](#)
- [show running-config lldp](#)

# location civic-location-id

**Overview** Use this command to assign a civic address location to the ports. The civic address location must already exist. This replaces any previous assignment of civic address location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

**Syntax** `location civic-location-id <civic-loc-id>`  
`no location civic-location-id [<civic-loc-id>]`

Parameter	Description
<code>&lt;civic-loc-id&gt;</code>	Civic address location ID, in the range 1 to 4095.

**Default** By default no civic address location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** The civic address location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, create the location using the following commands:

- [location civic-location identifier](#) command
- [location civic-location configuration](#) command

If a civic-address location is deleted using the **no** variant of the [location civic-location identifier](#) command, it is automatically removed from all ports.

**Examples** To assign the civic address location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location civic-location-id 1
```

To remove a civic address location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location civic-location-id
```

**Related commands** [lldp med-tlv-select](#)  
[location civic-location identifier](#)  
[location civic-location configuration](#)  
[show location](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# location coord-location configuration

**Overview** Use this command to configure a coordinate-based location. All parameters must be configured before assigning this location identifier to a port.

**Syntax**

```
latitude <latitude>
lat-resolution <lat-resolution>
longitude <longitude>
long-resolution <long-resolution>
altitude <altitude> {meters|floor}
alt-resolution <alt-resolution>
datum {wgs84|nad83-navd|nad83-mllw}
```

Parameter	Description
<lat-resolution>	Latitude resolution, as a number of valid bits, in the range 0 to 34.
<latitude>	Latitude value in degrees in the range -90.0 to 90.0
<long-resolution>	Longitude resolution, as a number of valid bits, in the range 0 to 34.
<longitude>	Longitude value in degrees, in the range -180.0 to 180.0.
<alt-resolution>	Altitude resolution, as a number of valid bits, in the range 0 to 30. A resolution of 0 can be used to indicate an unknown value.
<altitude>	Altitude value, in meters or floors.
meters	The altitude value is in meters.
floors	The altitude value is in floors.
datum	The geodetic system (or datum) that the specified coordinate values are based on.
wgs84	World Geodetic System 1984.
nad83-navd	North American Datum 1983 - North American Vertical Datum.
nad83-mllw	North American Datum 1983 - Mean Lower Low Water vertical datum.

**Default** By default no coordinate location information is configured.

**Mode** Coordinate Configuration

**Usage** Latitude and longitude values are always stored internally, and advertised in the Location Identification TLV, as 34-bit fixed-point binary numbers, with a 25-bit fractional part, irrespective of the number of digits entered by the user. Likewise

altitude is stored as a 30-bit fixed point binary number, with an 8-bit fractional part. Because the user-entered decimal values are stored as fixed point binary numbers, they cannot always be represented exactly—the stored binary number is converted to a decimal number for display in the output of the [show location](#) command. For example, a user-entered latitude value of “2.77” degrees is displayed as “2.7699999809265136718750000”.

The **lat-resolution**, **long-resolution**, and **alt-resolution** parameters allow the user to specify the resolution of each coordinate element as the number of valid bits in the internally-stored binary representation of the value. These resolution values can be used by emergency services to define a search area.

To specify the coordinate identifier, use the [location coord-location identifier](#) command. To remove coordinate information, delete the coordinate location by using the **no** variant of that command. To associate the coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the [location elin-location-id](#) command.

**Example** To configure the location for the White House in Washington DC, which has the coordinates based on the WGS84 datum of 38.89868 degrees North (with 22 bit resolution), 77.03723 degrees West (with 22 bit resolution), and 15 meters height (with 9 bit resolution), use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)# la-resolution 22
awplus(config-coord)# latitude 38.89868
awplus(config-coord)# lo-resolution 22
awplus(config-coord)# longitude -77.03723
awplus(config-coord)# alt-resolution 9
awplus(config-coord)# altitude 15 meters
awplus(config-coord)# datum wgs84
```

**Related commands**

# location coord-location identifier

**Overview** Use this command to enter Coordinate Location Configuration mode for this coordinate location.

Use the **no** variant of this command to delete a coordinate location. This also removes the location from any ports it has been assigned to.

**Syntax** `location coord-location identifier <coord-loc-id>`  
`no location coord-location identifier <coord-loc-id>`

Parameter	Description
<code>&lt;coord-loc-id&gt;</code>	A unique coordinate location identifier, in the range 1 to 4095.

**Default** By default there are no coordinate locations.

**Mode** Global Configuration

**Usage** Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To configure this coordinate location, use the [location coord-location configuration](#) command. To associate this coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the [location coord-location-id](#) command.

**Examples** To enter Coordinate Location Configuration mode to configure the coordinate location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)#
```

To delete coordinate location 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location coord-location identifier 1
```

**Related commands** [location coord-location-id](#)  
[location coord-location configuration](#)

# location elin-location

**Overview** Use this command to create or modify an ELIN location.

Use the **no** variant of this command to delete an ELIN location, and remove it from any ports it has been assigned to.

**Syntax** `location elin-location <elin> identifier <elin-loc-id>`  
`no location elin-location identifier <elin-loc-id>`

Parameter	Description
<code>&lt;elin&gt;</code>	Emergency Location Identification Number (ELIN) for Emergency Call Service (ECS), in the range 10 to 25 digits long. In North America, ELINs are typically 10 digits long.
<code>&lt;elin-loc-id&gt;</code>	A unique ELIN location identifier, in the range 1 to 4095.

**Default** By default there are no ELIN location identifiers.

**Mode** Global Configuration

**Usage** Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To assign this ELIN location to particular ports, so that it can be advertised in TLVs from those ports, use the [location elin-location-id](#) command.

**Examples** To create a new ELIN location with ID 1, and configure it with ELIN "1234567890", use the commands:

```
awplus# configure terminal
awplus(config)# location elin-location 1234567890 identifier 1
```

To delete existing ELIN location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location elin-location identifier 1
```

**Related commands** [location elin-location-id](#)  
[show lldp local-info](#)

# location elin-location-id

**Overview** Use this command to assign an ELIN location to the ports. The ELIN location must already exist. This replaces any previous assignment of ELIN location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

**Syntax** `location elin-location-id <elin-loc-id>`  
`no location elin-location-id [<elin-loc-id>]`

Parameter	Description
<code>&lt;elin-loc-id&gt;</code>	ELIN location identifier, in the range 1 to 4095.

**Default** By default no ELIN location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** An ELIN location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the [location elin-location](#) command.

If an ELIN location is deleted using the **no** variant of one of the [location elin-location](#) command, it is automatically removed from all ports.

**Examples** To assign ELIN location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location elin-location-id 1
```

To remove ELIN location 1 from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location elin-location-id 1
```

# show debugging lldp

**Overview** This command displays LLDP debug settings for specified ports. If no port list is supplied, LLDP debug settings for all ports are displayed.

**Syntax** `show debugging lldp [interface <port-list>]`

Parameter	Description
<port-list>	The ports for which the LLDP debug settings are shown.

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP debug settings for all ports, use the command:

```
awplus# show debugging lldp
```

To display LLDP debug settings for ports 1.0.1 to 1.0.6, use the command:

```
awplus# show debugging lldp interface port1.0.1-1.0.6
```

**Output** Figure 70-1: Example output from the **show debugging lldp** command

```
LLDP Debug settings:
Debugging for LLDP internal operation is on
Port Rx RxPkt Tx TxPkt

1.0.1 Yes Yes No No
1.0.2 Yes No No No
1.0.3 No No No No
1.0.4 Yes Yes Yes No
1.0.5 Yes No Yes No
1.0.6 Yes Yes Yes Yes
```

**Table 1:** Parameters in the output of the **show debugging lldp** command

Parameter	Description
Port	Port name.
Rx	Whether debugging of LLDP receive is enabled on the port.
RxPkt	Whether debugging of LLDP receive packet dump is enabled on the port.
Rx	Whether debugging of LLDP transmit is enabled on the port.
RxPkt	Whether debugging of LLDP transmit packet dump is enabled on the port.

**Related  
commands** [debug lldp](#)

# show lldp

**Overview** This command displays LLDP status and global configuration settings.

**Syntax** show lldp

**Mode** User Exec and Privileged Exec

**Example** To display LLDP status and global configuration settings, use the command:

```
awplus# show lldp
```

## Output

**Table 2:** Example output from the **show lldp** command

```
awplus# show lldp

LLDP Global Configuration: [Default Values]
LLDP Status Enabled [Disabled]
Notification Interval 5 secs [5]
Tx Timer Interval 30 secs [30]
Hold-time Multiplier 4 [4]
(Computed TTL value 120 secs)
Reinitialization Delay 2 secs [2]
Tx Delay 2 secs [2]

Port Number Type..... Ifindex [Port-Number]
Fast Start Count 5 [3]

LLDP Global Status:
Total Neighbor Count 47
Neighbors table last updated 0 hrs 0 mins 43 secs ago
```

**Table 3:** Parameters in the output of the **show lldp** command

Parameter	Description
LLDP Status	Whether LLDP is enabled. Default is disabled.
Notification Interval	Minimum interval between LLDP notifications.
Tx Timer Interval	Transmit interval between regular transmissions of LLDP advertisements.
Hold-time Multiplier	The holdtime multiplier. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors.
Reinitialization Delay	The reinitialization delay. This is the minimum time after disabling LLDP transmit on a port before it can reinitialize again.

**Table 3:** Parameters in the output of the **show lldp** command (cont.)

Parameter	Description
Tx Delay	The transmission delay. This is the minimum time interval between transmitting advertisements due to a change in LLDP local information.
Port Number Type	The type of port identifier used to enumerate LLDP MIB local port entries, as set by the lldp port-number-type command.
Fast Start Count	The number of times fast start advertisements are sent for LLDP-MED.
Total Neighbor Count	Number of LLDP neighbors discovered on all ports.
Neighbors table last updated	The time since the LLDP neighbor table was last updated.

**Related commands** [show lldp interface](#)  
[show running-config lldp](#)

# show lldp interface

**Overview** This command displays LLDP configuration settings for specified ports. If no port list is specified, LLDP configuration for all ports is displayed.

**Syntax** `show lldp interface [<port-list>]`

Parameter	Description
<port-list>	The ports for which the LLDP configuration settings are to be shown.

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP configuration settings for ports 1.0.1 to 1.0.6, use the command:

```
awplus# show lldp interface port1.0.1-1.0.6
```

To display LLDP configuration settings for all ports, use the command:

```
awplus# show lldp interface
```

**Output** Figure 70-2: Example output from the **show lldp interface** command

```
awplus# show lldp interface port1.0.1-1.0.8

**Related commands** [show lldp](#)  
[show running-config lldp](#)

# show lldp local-info

**Overview** This command displays local LLDP information that can be transmitted through specified ports. If no port list is entered, local LLDP information for all ports is displayed.

**Syntax** `show lldp local-info [base] [dot1] [dot3] [med] [interface <port-list>]`

Parameter	Description
base	Information for base TLVs.
dot1	Information for 802.1 TLVs.
dot3	Information for 802.3 TLVs.
med	Information for LLDP-MED TLVs.
<port-list>	The ports for which the local information is to be shown.

**Mode** User Exec and Privileged Exec

**Usage notes** Whether and which local information is transmitted in advertisements via a port depends on:

- whether the port is set to transmit LLDP advertisements ([lldp transmit receive](#) command)
- which TLVs it is configured to send ([lldp tlv-select](#) command, [lldp med-tnv-select](#) command)

**Examples** To display local information transmitted via port 1.0.1, use the command:

```
awplus# show lldp local-info interface port1.0.1
```

To display local information transmitted via all ports, use the command:

```
awplus# show lldp local-info
```

**Output** Figure 70-3: Example output from **show lldp local-info**

```
LLDP Local Information:

```

Table 70-1: Parameters in the output of **show lldp local-info**

Parameter	Description
Chassis ID Type	Type of the Chassis ID.
Chassis ID	Chassis ID that uniquely identifies the local device.
Port ID Type	Type of the Port ID.
Port ID	Port ID of the local port through which advertisements are sent.
TTL	Number of seconds that the information advertised by the local port remains valid.
Port Description	Port description of the local port, as specified by the <a href="#">description (interface)</a> command.
System Name	System name, as specified by the <a href="#">hostname</a> command.
System Description	System description.
System Capabilities (Supported)	Capabilities that the local port supports.
System Capabilities (Enabled)	Enabled capabilities on the local port.
Management Addresses	Management address associated with the local port. To change this, use the <a href="#">lldp management-address</a> command.
Port VLAN ID (PVID)	VLAN identifier associated with untagged or priority tagged frames received via the local port.
Port & Protocol VLAN (Supported)	Whether Port & Protocol VLANs (PPV) is supported on the local port.
Port & Protocol VLAN (Enabled)	Whether the port is in one or more Port & Protocol VLANs.
Port & Protocol VLAN (VIDs)	List of identifiers for Port & Protocol VLANs that the port is in.
VLAN Names	List of VLAN names for VLANs that the local port is assigned to.
Protocol IDs	List of protocols that are accessible through the local port.
MAC/PHY Auto-negotiation	Auto-negotiation support and current status of the 802.3 LAN on the local port.

Table 70-1: Parameters in the output of **show lldp local-info** (cont.)

Parameter	Description
Power Via MDI (PoE)	PoE-capability and current status on the local port.
Port Class	Whether the device is a PSE (Power Sourcing Entity) or a PD (Powered Device)
Pair Control Ability	Whether power pair selection can be controlled
Power Pairs	Which power pairs are selected for power ("Signal Pairs" or "Spare Pairs") if pair selection can be controlled
Power Class	The power class of the PD device on the port (class 0, 1, 2, 3 or 4)
Link Aggregation	Whether the link is capable of being aggregated and it is currently in an aggregation.
Aggregated Port-ID	Aggregated port identifier.
Maximum Frame Size	The maximum frame size capability of the implemented MAC and PHY.
LLDP-MED Device Type	LLDP-MED device type
LLDP-MED Capabilities	Capabilities LLDP-MED capabilities supported on the local port.
Network Policy	List of network policies configured on the local port.
VLAN ID	VLAN identifier for the port for the specified application type
Tagged Flag	Whether the VLAN ID is to be used as tagged or untagged
Layer-2 Priority:	Layer 2 User Priority (in the range 0 to 7)
DSCP Value	Diffserv codepoint (in the range 0 to 63)
Location Identification	Location configured on the local port.
Extended Power Via MDI (PoE)	PoE-capability and current status of the PoE parameters for Extended Power-Via-MDI TLV on the local port.
Power Source	The power source the switch currently uses; either primary power or backup power.
Power Priority	The power priority configured on the port; either critical, high or low.

Table 70-1: Parameters in the output of **show lldp local-info** (cont.)

Parameter	Description
Power Value	The total power the switch can source over a maximum length cable to a PD device on the port. The value shows the power value in Watts from the PD side.
Inventory Management	Inventory information for the device.

**Table 72:** Parameters in the output of the **show lldp neighbors detail** command

Parameter	Description
Chassis ID Type	Type of the Chassis ID.
Chassis ID	Chassis ID that uniquely identifies the neighbor.
Port ID Type	Type of the Port ID.
Port ID	Port ID of the neighbor.
TTL	Number of seconds that the information advertised by the neighbor remains valid.
Port Description	Port description of the neighbor's port.
System Name	Neighbor's system name.
System Description	Neighbor's system description.
System Capabilities (Supported)	Capabilities that the neighbor supports.
System Capabilities (Enabled)	Capabilities that are enabled on the neighbor.
Management Addresses	List of neighbor's management addresses.
Port VLAN ID (PVID)	VLAN identifier associated with untagged or priority tagged frames for the neighbor port.
Port & Protocol VLAN (Supported)	Whether Port & Protocol VLAN is supported on the LLDP neighbor.
Port & Protocol VLAN (Enabled)	Whether Port & Protocol VLAN is enabled on the LLDP neighbor.
Port & Protocol VLAN (VIDs)	List of Port & Protocol VLAN identifiers.
VLAN Names	List of names of VLANs that the neighbor's port belongs to.
Protocol IDs	List of protocols that are accessible through the neighbor's port.
MAC/PHY Auto-negotiation	Auto-negotiation configuration and status
Power Via MDI (PoE)	PoE configuration and status of 802.3 Power-Via-MDI TLV
Link Aggregation	Link aggregation information

**Table 72:** Parameters in the output of the **show lldp neighbors detail** command (cont.)

Inventory Management	Inventory information

**Related commands** [show lldp neighbors](#)

# show lldp statistics

**Overview** This command displays the global LLDP statistics (packet and event counters).

**Syntax** show lldp statistics

**Mode** User Exec and Privileged Exec

**Example** To display global LLDP statistics information, use the command:

```
awplus# show lldp statistics
```

## Output

**Table 73:** Example output from the **show lldp statistics** command

```
awplus# show lldp statistics

Global LLDP Packet and Event counters:

Frames: Out 345
 In 423
 In Errored 0
 In Dropped 0
TLVs: Unrecognized 0
 Discarded 0
Neighbors: New Entries 20
 Deleted Entries 20
 Dropped Entries 0
 Entry Age-outs 20
```

**Table 74:** Parameters in the output of the **show lldp statistics** command

Parameter	Description
Frames Out	Number of LLDPDU frames transmitted.
Frames In	Number of LLDPDU frames received.
Frames In Errored	Number of invalid LLDPDU frames received.
Frames In Dropped	Number of LLDPDU frames received and discarded for any reason.
TLVs Unrecognized	Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types.
TLVs Discarded	Number of LLDP TLVs discarded for any reason.
Neighbors New Entries	Number of times the information advertised by neighbors has been inserted into the neighbor table.

**Table 74:** Parameters in the output of the **show lldp statistics** command (cont.)

Parameter	Description
Neighbors Deleted Entries	Number of times the information advertised by neighbors has been removed from the neighbor table.
Neighbors Dropped Entries	Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.
Neighbors Entry Age-outs Entries	Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired.

**Related commands** [clear lldp statistics](#)  
[show lldp statistics](#)

# show location

**Overview** Use this command to display selected location information configured on the switch.

**Syntax**

```
show location {civic-location|coord-location|elin-location}
show location {civic-location|coord-location|elin-location}
identifier {<civic-loc-id>|<coord-loc-id>|<elin-loc-id>}
show location {civic-location|coord-location|elin-location}
interface <port-list>
```

Parameter	Description
civic-location	Display civic location information.
coord-location	Display coordinate location information.
elin-location	Display ELIN (Emergency Location Identifier Number) information.
<civic-loc-id>	Civic address location identifier, in the range 1 to 4095.
<coord-loc-id>	Coordinate location identifier, in the range 1 to 4095.
<elin-loc-id>	ELIN location identifier, in the range 1 to 4095.
<port-list>	Ports to display information about.

**Mode** User Exec and Privileged Exec

**Examples** To display a civic address location configured on port 1.0.1, use the command:

```
awplus# show location civic-location interface port1.0.1
```

**Table 77:** Example output from the **show location** command

```
awplus# show location civic-location interface port1.0.1
Port ID Element Type Element Value

1.0.1 1 Country NZ
 City Christchurch
 Street-suffix Avenue
 House-number 27
 Primary-road-name Nazareth
```

To display coordinate location information configured on the identifier 1, use the command:

```
awplus# show location coord-location identifier 1
```

**Table 78:** Example output from the **show location** command

```
awplus# show location coord-location identifier 1
 ID Element Type Element Value

 1 Latitude Resolution 15 bits
 Latitude 38.8986481130123138427734375 degrees
 Longitude Resolution 15 bits
 Longitude 130.2323232293128967285156250 degrees
 Altitude Resolution 10 bits
 Altitude 2.50000000 meters
 Map Datum WGS 84
```

The coordinate location information displayed may differ from the information entered because it is stored in binary format. For more information, see the [location coord-location configuration](#) command.

To display all ELIN location information configured on the switch, use the command:

```
awplus# show location elin-location
```

**Table 79:** Example output from the **show location elin-location** command

```
awplus# show location elin-location
 ID ELIN

 1 1234567890
 2 5432154321
```

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure mail. The mail feature uses Simple Mail Transfer Protocol (SMTP) to transfer mail from an internal email client operating within the AlliedWare Plus device. This feature is typically used to email event notifications to an external email server from the AlliedWare Plus device.

For information on using the mail feature, see the [Mail \(SMTP\) Feature Overview and Configuration Guide](#).

- Command List**

# debug mail

**Overview** This command turns on debugging for sending emails.  
The **no** variant of this command turns off debugging for sending emails.

**Syntax** debug mail  
no debug mail

**Mode** Privileged Exec

**Examples** To turn on debugging for sending emails, use the command:

```
awplus# debug mail
```

To turn off debugging for sending emails, use the command:

```
awplus# no debug mail
```

**Related commands**

- delete mail
- mail
- mail from
- mail smtpserver
- show counter mail
- show mail
- undebug mail

# delete mail

**Overview** This command deletes mail from the queue.

You need the *mail-id* from the **show mail** command output to delete specific emails, or use the **all** parameter to clear all messages in the queue completely.

**Syntax** `delete mail [mail-id <mail-id>|all]`

Parameter	Description
mail-id	Deletes a single mail from the mail queue.
	<mail-id> A unique mail ID number. Use the <a href="#">show mail</a> command to display this for an item of mail.
all	Delete all the mail in the queue.

**Mode** Privileged Exec

**Examples** To delete the unique mail item "20060912142356.1234" from the queue, use the command:

```
awplus# delete mail 20060912142356.1234
```

To delete all mail from the queue, use the command:

```
awplus# delete mail all
```

**Related commands**

- [debug mail](#)
- [mail](#)
- [mail from](#)
- [mail smtpserver](#)
- [show mail](#)

# mail

**Overview** This command sends an email using the SMTP protocol. If you specify a file the text inside the file is sent in the message body.

If you do not specify the **to**, **file**, or **subject** parameters, the CLI prompts you for the missing information.

Before you can send mail using this command, you must specify the sending email address using the [mail from](#) command and a mail server using the [mail smtpserver](#) command.

**Syntax** mail [to <to>] [subject <subject>] [file <filename>]

Parameter	Description
to	The email recipient.  <to> Email address.
subject	Description of the subject of this email. Use quote marks when the subject text contains spaces.  <subject> String.
file	File to insert as text into the message body.  <filename> String.

**Mode** Privileged Exec

**Usage notes** When you use the **mail** command you can use parameter substitutions in the subject field. The following table lists the parameters that can be substituted and their descriptions:

Parameter	Description
<%N>	When this parameter is specified, the %N is replaced by the host name of your device.
<%S>	When this parameter is specified, the %S is replaced by the serial number of your device.
<%D> <%L> <%T>	When any of these parameters is specified, they are replaced by the current date and time (local time) on your device.
<%U>	When this parameter is specified, the %U is replaced by the current date and time (UTC time) on your device.

**NOTE:** If no local time is configured, it will use UTC.

**Examples** To send an email to "admin@example.com" with the subject "test email" and with the message body inserted from the file "test.conf", use the command:

```
awplus# mail to admin@example.com subject "test email" filename
test.conf
```

To send an email using parameter substitutions for the host name, serial number and date, use the commands:

```
awplus# mail to admin@example.com subject "Sending email from
Hostname:%N Serial Number:%S Date:%T"
```

# mail from

**Overview** This command sets an email address as the sender. You must specify a sending email address with this command before you can send email.

Use the **no** variant of this command to remove the “mail from” address.

**Syntax** mail from <from>  
no mail from

Parameter	Description
<from>	The email address that the mail is sent from (also known as the hostname).

**Mode** Global Configuration

**Example** To set up your email address as the sender “kaji@nerv.com”, use the command:

```
awplus(config)# mail from kaji@nerv.com
```

**Related commands**

- debug mail
- delete mail
- mail
- mail smtpserver

- undebg mail

# mail smtpserver

**Overview** This command specifies the IP address or domain name of the SMTP server that your device sends email to. You must specify a mail server with this command before you can send email.

Use the **no** variant of this command to remove the configured mail server.

**Syntax** mail smtpserver {<ip-address>|<name>}  
no mail smtpserver

Parameter	Description
<ip-address>	Internet Protocol (IP) address for the mail server.
<name>	Domain name (FQDN) for the mail server (also known as the host name).

**Mode** Global Configuration

**Usage notes** If you specify the server by specifying its domain name, you must also ensure that the DNS client on your device is enabled. It is enabled by default but if it has been disabled, you can re-enable it by using the [ip domain-lookup](#) command.

**Examples** To specify a mail server at "192.168.0.1", use the command:

```
awplus(config)# mail smtpserver 192.168.0.1
```

To specify a mail server that has a host name of "smtp.example.com", use the command:

```
awplus(config)# mail smtpserver smtp.example.com
```

To remove the configured mail server, use the command:

```
awplus(config)# no mail smtpserver
```

# mail smtpserver authentication

**Overview** Use this command to configure SMTP mail server authentication.

Use the **no** variant of this command to remove the configured SMTP mail server authentication.

**Syntax** mail smtpserver authentication {crammd5|login|plain} username <username> password [8] <password>  
no mail smtpserver authentication

Parameter	Description
crammd5	This is a Challenge Request Authentication Mechanism based on the HMAC-MD5 mechanism and is the most secure option.
login	A BASE64 encryption method
plain	A BASE64 encryption method
<username>	Registered user name
8	The registered user password is presented in an already encrypted format. This is how the running configuration stores the plain text password and is not for general use.
<password>	Registered user password

**Default** No authentication option is set by default.

**Mode** Global Configuration

**Usage notes** You cannot change the IP address or Domain Name of the SMTP server if authentication is configured. If you attempt to change it when authentication is configured, the following error message is displayed:

```
% Error: authentication configuration still exists
```

**Examples** To configure the SMTP mail server authentication to crammd5, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver authentication crammd5 username
admin password unguessablePassword
```

To remove SMTP mail server authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver authentication
```

**Output** Figure 71-1: Example output from **show mail**:

```
awplus#show mail
Mail Settings

changes**

Version 5.4.8-1.1: command added

# mail smtpserver port

**Overview** Use this command to configure the SMTP mail client/server communication port. Use the **no** variant of this command to remove the configured port and set it back to the default port 25.

**Syntax** mail smtpserver port <port>  
no mail smtpserver port

Parameter	Description
<port>	Port number from the range 1 to 65535

**Default** Port 25 is the default port.

**Mode** Global Configuration

**Examples** To configure the mail server communication over port 587, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver port 587
```

To remove the configured port and set it back to the default port 25, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver port
```

**Output** Figure 71-2: Example output from **show mail**:

```
awplus#show mail
Mail Settings

State : Alive
SMTP Server : 10.24.165.4
Host Name : admin@example.com
Authentication : plain
Username : admin
Port : 587
Debug : Disabled

# RMON Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Remote Monitoring (RMON).

For an introduction to RMON and an RMON configuration example, see the [RMON Feature Overview and Configuration Guide](#).

RMON is disabled by default in AlliedWare Plus™. No RMON alarms or events are configured.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

  - [“show rmon statistics”](#) on page 3910

# rmon alarm

**Overview** Use this command to configure an RMON alarm to monitor the value of an SNMP object, and to trigger specified events when the monitored object crosses specified thresholds.

To specify the action taken when the alarm is triggered, use the event index of an event defined by the [rmon event](#) command.

Use the **no** variant of this command to remove the alarm configuration.

**NOTE:** You can only configure alarms for switch port interfaces, not for VLANs.

**Syntax** **User-defined alarm:**

```
rmon alarm <alarm-index> <oid.index> interval <1-2147483647>
{delta|absolute} rising-threshold <1-2147483647> event
<rising-event-index> falling-threshold <1-2147483647> event
<falling-event-index> [alarmstartup {1|2|3}] [owner <owner>]
```

**Eventwatch alarm, do not use (used by Vista Manager EX only):**

```
rmon alarm <alarm-index> <oid.index> interval <1-4294967295>
{delta|absolute} rising-threshold <1-2147483647> event
eventwatch falling-threshold <1-2147483647> event eventwatch
[owner <owner>]
```

```
no rmon alarm <alarm-index>
```

Parameter	Description
<alarm-index>	Alarm entry index value from the range 1 to 65535 seconds.
<oid.index>	The variable SNMP MIB Object Identifier (OID) name to be monitored, for either etherStats or etherHistory entries. The entries can be either of the following formats: - etherStatsEntry.<field>.<stats-index> or etherHistoryEntry.<field>.<history-index>, or - etherStatsFieldName.<stats-index> or etherHistoryFieldName.<history-index>. To define the <stats-index>, use the <a href="#">rmon collection stats</a> command. To define the <history-index>, use the <a href="#">rmon collection history</a> command.
interval <1-2147483647>	Polling interval in seconds from the range 1 to 2147483647.
delta	The RMON MIB alarmSampleType: the change in the monitored MIB object value between the beginning and end of the polling interval.
absolute	The RMON MIB alarmSampleType: the value of the monitored MIB object.

Parameter	Description
rising-threshold <1-2147483647>	Rising threshold value of the alarm entry in seconds from the range 1 to 2147483647.
<rising-event-index>	From the range 1 to 65535 seconds. The event to be triggered when the monitored object value reaches the rising threshold value. This is the event index of an event specified by the <code>rmon event</code> command.
eventwatch	The alarm triggers an eventwatch event. This mechanism is used by Vista Manager EX, the Allied Telesis network management and monitoring tool. Do not use this parameter; use the <code>&lt;rising-event-index&gt;</code> parameter instead.
falling-threshold <1-2147483647>	Falling threshold value of the alarm entry in seconds from the range 1 to 2147483647.
<falling-event-index>	From the range 1 to 65535 seconds. The event to be triggered when the monitored object value reaches the falling threshold value. This is an event index of an event specified by the <code>rmon event</code> command.
eventwatch	The alarm triggers an eventwatch event. This mechanism is used by Vista Manager EX, the Allied Telesis network management and monitoring tool. Do not use this parameter; use the <code>&lt;rising-event-index&gt;</code> parameter instead.
alarmstartup {1 2 3}	Whether RMON can trigger a falling alarm (1), a rising alarm (2) or either (3) when you first start monitoring. See the Usage section for more information. The default is setting 3 (either).
owner <owner>	Arbitrary owner name to identify the alarm entry.

**Default** By default, there are no alarms.

**Mode** Global Configuration

**Usage notes** RMON alarms have a rising and falling threshold. Once the alarm monitoring is operating, you cannot have a falling alarm unless there has been a rising alarm and vice versa.

However, when you start RMON alarm monitoring, an alarm must be generated without the other type of alarm having first been triggered. The **alarmstartup** parameter allows this. It is used to say whether RMON can generate a rising alarm (1), a falling alarm (2) or either alarm (3) as the first alarm.

Note that you specify the SNMP MIB Object Identifier (OID) as a dotted decimal value, using one of the following forms:

- etherStatsEntry.<field>.<stats-index> or  
etherHistoryEntry.<field>.<history-index>.  
For example, etherHistoryEntry.8.8

- or, etherStatsFieldName.<stats-index> or etherHistoryFieldName.<history-index>. For example, etherHistoryMulticastPkts.8

If you enter the first form (etherHistoryEntry.8.8), the device will save it as the second form (etherHistoryMulticastPkts.8) in the running-config.

**Example** To configure an alarm to:

- monitor the change per minute in the etherStatsPkt value for interface 22 (defined by stats-index 22 in the [rmon collection stats](#) command)
- and trigger event 2 (defined by the [rmon event](#) command) when the change reaches the rising threshold 400
- and trigger event 3 when it reaches the falling threshold 200
- and identify this alarm as belonging to the user with username Maria

use the following commands:

```
awplus# configure terminal
awplus(config)# rmon alarm 229 etherStatsEntry.22.5 interval 60
delta rising-threshold 400 event 2 falling-threshold 200 event
3 alarmstartup 3 owner maria
```

To configure an alarm that:

- every 10 seconds, checks the number of multicast packets
- in the latest history control table entry controlled by history-index 8
- to see if the number of packets has increased to 15 or dropped to 5
- and if it has, trigger event 10

use either of the following commands:

```
awplus(config)# rmon alarm 56 etherHistoryMulticastPkts.8
interval 10 absolute rising-threshold 15 event 10
falling-threshold 5 event 10

awplus(config)# rmon alarm 56 etherHistoryEntry.8.8 interval 10
absolute rising-threshold 15 event 10 falling-threshold 5 event
10
```

**Related commands** [rmon collection history](#)  
[rmon collection stats](#)  
[rmon event](#)

# rmon collection history

**Overview** Use this command to create a history statistics control group to store a specified number of snapshots (buckets) of the standard RMON statistics for the switch port, and to collect these statistics at specified intervals. If there is sufficient memory available, then the device will allocate memory for storing the set of buckets that comprise this history control.

Use the **no** variant of this command to remove the specified history control configuration.

**NOTE:** A history can only be collected for switch port interfaces, not for VLANs.

**Syntax** `rmon collection history <history-index> [buckets <1-65535>]  
[interval <1-3600>] [owner <owner>]  
no rmon collection history <history-index>`

Parameter	Description
<history-index>	A unique RMON history control entry index value from the range 1 to 65535.
buckets <1-65535>	Number of requested buckets to store snapshots from the range 1 to 65535. The default is 50 buckets.
interval <1-3600>	Polling interval in seconds. Default 1800 second polling interval from the range 1 to 3600.
owner <owner>	Owner name to identify the entry.

**Default** The default interval is 1800 seconds and the default number of buckets is 50.

**Mode** Interface Configuration

**Example** To create a history statistics control group with ID 200 to store 500 snapshots with an interval of 600 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection history 200 buckets 500
interval 600 owner herbert
```

To disable the history statistics control group, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection history 200
```

**Related commands** [rmon alarm](#)  
[rmon collection stats](#)  
[rmon event](#)

# rmon collection stats

**Overview** Use this command to enable the collection of RMON statistics on a switch port, and assign an index number by which to access these collected statistics.

Use the **no** variant of this command to stop collecting RMON statistics on this switch port.

**NOTE:** *Statistics can only be collected for switch port interfaces, not for VLANs.*

**Syntax** `rmon collection stats <collection-index> [owner <owner>]`  
`no rmon collection stats <collection-index>`

Parameter	Description
<code>&lt;collection-index&gt;</code>	Give this collection of statistics an index number to uniquely identify it. This is the index to use to access the statistics collected for this switch port. Use a number in the range of 1 to 65535.
<code>owner &lt;owner&gt;</code>	An arbitrary owner name to identify this statistics collection entry.

**Default** RMON statistics are not enabled by default.

**Mode** Interface Configuration

**Example** To enable the collection of RMON statistics with a statistics index of 200, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection stats 200 owner myrtle
```

To stop collecting RMON statistics, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection stats 200
```

**Related commands** [rmon alarm](#)  
[rmon collection history](#)  
[rmon event](#)

# rmon event

**Overview** Use this command to create an event definition for a log or a trap or both. Then you can use this event index in the [rmon alarm](#) command to indicate whether to send an SNMP trap or log message (or both) when an alarm is triggered.

Use the **no** variant of this command to remove the event definition.

**Syntax**

```
rmon event <event-index> [description <description>|owner <owner>| trap <trap>]
```

```
rmon event <event-index> [log [description <description>|owner <owner>|trap <trap>]]
```

```
rmon event <event-index> [log trap [description <description>|owner <owner>]]
```

```
no rmon event <event-index>
```

Parameter	Description
<event-index>	<1-65535> Unique event entry index value.
log	Log event type.
trap	Trap event type.
log trap	Log and trap event type.
description<description>	Event entry description.
owner <owner>	Owner name to identify the entry.

**Default** No event is configured by default.

**Mode** Global Configuration

**Example** To create an event definition with an index of 299 for a log, use this command:

```
awplus# configure terminal
awplus(config)# rmon event 299 log description cond3 owner
alfred
```

To remove the event definition, use the command:

```
awplus# configure terminal
awplus(config)# no rmon event 299
```

**Related commands** [rmon alarm](#)

# show rmon alarm

**Overview** Use this command to display the alarms and threshold configured for the RMON probe.

**Syntax** `show rmon alarm`

**Mode** User Exec and Privileged Exec

**Example** To display the alarms and threshold, use this command:

```
awplus# show rmon alarm
```

**Related commands** [rmon alarm](#)

# show rmon event

**Overview** Use this command to display the events configured for the RMON probe.

**Syntax** show rmon event

**Mode** User Exec and Privileged Exec

**Output** Figure 72-1: Example output from the **show rmon event** command

```
awplus#sh rmon event
event Index = 787
 Description TRAP
 Event type log & trap
 Event community name gopher
 Last Time Sent = 0
 Owner RMON_SNMP

event Index = 990
 Description TRAP
 Event type trap
 Event community name teabo
 Last Time Sent = 0
 Owner RMON_SNMP
```

**NOTE:** The following etherStats counters are not currently available for Layer 3 interfaces:

- etherStatsBroadcastPkts
- etherStatsCRCAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers
- etherStatsCollisions
- etherStatsPkts64Octets
- etherStatsPkts65to127Octets
- etherStatsPkts128to255Octets
- etherStatsPkts256to511Octets
- etherStatsPkts512to1023Octets
- etherStatsPkts1024to1518Octets

**Example** To display the events configured for the RMON probe, use this command:

```
awplus# show rmon event
```

**Related  
commands** [rmon event](#)

# show rmon history

**Overview** Use this command to display the parameters specified on all the currently defined RMON history collections on the device.

**Syntax** `show rmon history`

**Mode** User Exec and Privileged Exec

**Output** Figure 72-2: Example output from the **show rmon history** command

```
awplus#sh rmon history
history index = 56
 data source ifindex = 4501
 buckets requested = 34
 buckets granted = 34
 Interval = 2000
 Owner Andrew

history index = 458
 data source ifindex = 5004
 buckets requested = 400
 buckets granted = 400
 Interval = 1500
 Owner trev
=====
```

**NOTE:** The following etherStats counters are not currently available for Layer 3 interfaces:

- etherStatsBroadcastPkts
- etherStatsCRCAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers
- etherStatsCollisions
- etherStatsPkts64Octets
- etherStatsPkts65to127Octets
- etherStatsPkts128to255Octets
- etherStatsPkts256to511Octets
- etherStatsPkts512to1023Octets
- etherStatsPkts1024to1518Octets

**Example** To display the parameters specified on all the currently defined RMON history collections, use the commands:

```
awplus# show rmon history
```

**Related commands** [rmon collection history](#)

# show rmon statistics

**Overview** Use this command to display the current values of the statistics for all the RMON statistics collections currently defined on the device.

**Syntax** `show rmon statistics`

**Mode** User Exec and Privileged Exec

**Example** To display the current values of the statistics for all the RMON statistics collections, use the commands:

```
awplus# show rmon statistics
```

**Output** Figure 72-3: Example output from the **show rmon statistics** command

```
awplus#show rmon statistics
rmon collection index 45
stats->ifindex = 4501
input packets 1279340, bytes 85858960, dropped 00, multicast packets 1272100
output packets 7306090, bytes 268724, multicast packets 7305660 broadcast
packets 290
rmon collection index 679
stats->ifindex = 5013
input packets 00, bytes 00, dropped 00, multicast packets 00
output packets 8554550, bytes 26777324, multicast packets 8546690 broadcast
packets 7720
```

**NOTE:** The following etherStats counters are not currently available for Layer 3 interfaces:

- etherStatsBroadcastPkts
- etherStatsCRCAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers

# banner login (SSH)

**Overview** This command configures a login banner on the SSH server. This displays a message on the remote terminal of the SSH client before the login prompt. SSH client version 1 does not support this banner.

To add a banner, first enter the command **banner login**, and hit [Enter]. Write your message. You can use any character and spaces. Use Ctrl+D at the end of your message to save the text and re-enter the normal command line mode.

The banner message is preserved if the device restarts.

The **no** variant of this command deletes the login banner from the device.

**Syntax** banner login  
no banner login

**Default** No banner is defined by default.

**Mode** Global Configuration

**Examples** To set a login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# banner login
```

The screen will prompt you to enter the message:

Type CNTL/D to finish.

... banner message comes here ...

Enter the message. Use Ctrl+D to finish, like this:

```
^D
awplus(config)#
```

To remove the login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# no banner login
```

**Related commands** [show banner login](#)

# clear ssh

**Overview** This command deletes Secure Shell sessions currently active on the device. This includes both incoming and outgoing sessions. The deleted sessions are closed. You can only delete an SSH session if you are a system manager or the user who initiated the session. If **all** is specified then all active SSH sessions are deleted.

**Syntax** `clear ssh {<1-65535>|all}`

Parameters	Description
<1-65535>	Specify a session ID in the range 1 to 65535 to delete a specific session.
all	Delete all SSH sessions.

**Mode** Privileged Exec

**Examples** To stop the current SSH session 123, use the command:

```
awplus# clear ssh 123
```

To stop all SSH sessions active on the device, use the command:

```
awplus# clear ssh all
```

**Related commands** [service ssh](#)  
[ssh](#)

# crypto key destroy hostkey

**Overview** This command deletes the existing public and private keys of the SSH server.

**Syntax** `crypto key destroy hostkey {dsa|ecdsa|rsa|rsa1}`

Parameters	Description
dsa	Deletes the existing DSA public and private keys.
ecdsa	Deletes the existing ECDSA public and private keys.
rsa	Deletes the existing RSA public and private keys configured for SSH version 2 connections.
rsa1	Deletes the existing RSA public and private keys configured for SSH version 1 connections. From AlliedWare Plus version 5.5.1-1.1 onwards, SSH version 1 is not supported.

**Mode** Global Configuration

**Example** To destroy the RSA host key used for SSH version 2 connections, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy hostkey rsa
```

**Related commands** [crypto key generate hostkey](#)  
[service ssh](#)

# crypto key destroy userkey

**Overview** This command destroys the existing public and private keys of an SSH user configured on the device.

**Syntax** `crypto key destroy userkey <username> {dsa|rsa|rsa1}`

Parameters	Description
<code>&lt;username&gt;</code>	Name of the user whose userkey you are destroying. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
<code>dsa</code>	Deletes the existing DSA userkey.
<code>rsa</code>	Deletes the existing RSA userkey configured for SSH version 2 connections.
<code>rsa1</code>	Deletes the existing RSA userkey for SSH version 1 connections.

**Mode** Global Configuration

**Example** To destroy the RSA user key for the SSH user `remoteuser`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy userkey remoteuser rsa
```

**Related commands**

- [crypto key generate hostkey](#)
- [show ssh](#)
- [show crypto key hostkey](#)

# crypto key generate hostkey

**Overview** This command generates public and private keys for the SSH server.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using ECDSA with a curve length of 384, and RSA with a 1024-bit key (unless in secure mode, when it only generates the ECDSA key).

If you need a key with different parameters than this, you can use this command to generate that key before you enable the SSH server. If a host key exists with the same cryptography algorithm, this command replaces the old host key with the new key.

For maximum security in secure mode, we recommend using ECDSA host keys.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

**Syntax** `crypto key generate hostkey rsa [<768-32768>]`  
`crypto key generate hostkey ecdsa [<256|384>]`

Parameters	Description
rsa	Creates an RSA hostkey.
ecdsa	Creates an ECDSA hostkey.
<768-32768>	The length in bits of the generated key.
<256 384>	The ECDSA key size in bits.

**Default** The default key length for RSA is 1024 bits, except in secure mode. In secure mode, the default key length for RSA is 2048 bits.

The default key size for ECDSA is 256 bits.

**Mode** Global Configuration

**Examples** To generate an RSA host key that is 2048 bits in length, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey rsa 2048
```

To generate an ECDSA host key with an elliptic curve size of 384 bits, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey ecdsa 384
```

**Related commands** [crypto key destroy hostkey](#)  
[service ssh](#)  
[show crypto key hostkey](#)

**Command changes** Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# crypto key generate userkey

**Overview** This command generates public and private keys for an SSH user using either an RSA or ECDSA cryptography algorithm. To use public key authentication, copy the public key of the user onto the remote SSH server.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

**Syntax** `crypto key generate userkey <username> rsa [<768-32768>]`  
`crypto key generate userkey <username> ecdsa [<256|384>]`

Parameters	Description
<username>	Name of the user that the user key is generated for. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
rsa	Creates an RSA userkey for SSH version 2 connections.
ecdsa	Creates an ECDSA hostkey. Both SSH version 1 and 2 connections can use the ECDSA hostkey.
<768-32768>	The length in bits of the generated key. The default is 1024 bits.
<256 384>	The ECDSA key size in bits. The default is 256, but it can be set to 384.

**Mode** Global Configuration

**Examples** To generate a 2048-bits RSA user key for SSH version 2 connections for the user "bob", use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey bob rsa 2048
```

To generate an ECDSA user key of key size 384 for the user "lapo", use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo ecdsa 384
```

**Related commands** [crypto key pubkey-chain userkey](#)  
[show crypto key userkey](#)

# crypto key pubkey-chain knownhosts

**Overview** This command adds a public key of the specified SSH server to the known host database on your device. The SSH client on your device uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

**Syntax** `crypto key pubkey-chain knownhosts [ip|ipv6] <hostname> [ecdsa|rsa]`  
`no crypto key pubkey-chain knownhosts <1-65535>`

**Syntax (VRF-lite)** `crypto key pubkey-chain knownhosts [vrf <vrf-name>] [ip|ipv6] <hostname> [ecdsa|rsa]`  
`no crypto key pubkey-chain knownhosts [vrf <vrf-name>] <1-65535>`

Parameter	Description
vrf	Apply this command to the specified VRF instance.
<vrf-name>	The VRF instance name
ip	Keyword used prior to specifying an IPv4 address
ipv6	Keyword used prior to specifying an IPv6 address
<hostname>	IPv4/IPv6 address or hostname of a remote server in the format a.b.c.d for an IPv4 address, or in the format x:x::x:x for an IPv6 address.
ecdsa	Specify the ECDSA public key of the server to be added to the known host database.
rsa	Specify the RSA public key of the server to be added to the known host database.
<1-65535>	Specify a key identifier when removing a key using the <b>no</b> parameter.

**Default** If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

**Mode** Privilege Exec

**Usage notes** This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

**Examples** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

**Examples (VRF-lite)** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 in VRF 'red' to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts vrf red 192.0.2.11
```

To delete the second entry in the known host database in VRF 'red', use the command:

```
awplus# no crypto key pubkey-chain knownhosts vrf red 2
```

**Validation Commands** `show crypto key pubkey-chain knownhosts`

# crypto key pubkey-chain userkey

**Overview** This command adds a public key for an SSH user on the SSH server. This allows the SSH server to support public key authentication for the SSH user. When configured, the SSH user can access the SSH server without providing a password from the remote host.

The **no** variant of this command removes a public key for the specified SSH user that has been added to the public key chain. When a SSH user's public key is removed, the SSH user can no longer login using public key authentication.

**Syntax** `crypto key pubkey-chain userkey <username> [<filename>]`  
`no crypto key pubkey-chain userkey <username> <1-65535>`

Parameters	Description
<username>	Name of the user that the SSH server associates the key with. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. Default: no default
<filename>	Filename of a key saved in flash. Valid characters are any printable character. You can add a key as a hexadecimal string directly into the terminal if you do not specify a filename.
<1-65535>	The key ID number of the user's key. Specify the key ID to delete a key.

**Mode** Global Configuration

**Usage notes** You should import the public key file from the client node. The device can read the data from a file on the flash or user terminal.

Or you can add a key as text into the terminal. To add a key as text into the terminal, first enter the command **crypto key pubkey-chain userkey <username>**, and hit [Enter]. Enter the key as text. Note that the key you enter as text must be a valid SSH RSA key, not random ASCII text. Use [Ctrl]+D after entering it to save the text and re-enter the normal command line mode.

Note you can generate a valid SSH RSA key on the device first using the **crypto key generate host rsa** command. View the SSH RSA key generated on the device using the **show crypto hostkey rsa** command. Copy and paste the displayed SSH RSA key after entering the **crypto key pubkey-chain userkey <username>** command. Use [Ctrl]+D after entering it to save it.

**Examples** To generate a valid SSH RSA key on the device and add the key, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto key generate host rsa
awplus(config)# exit

awplus# show crypto key hostkey
rsaAAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWluhnUC768EoWhyPW6FZ2t5360O5M29EpKBmGq1kQaz5V0mU9IQe66+5YyD4UxOKSDtTI+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=

awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey joeType CNTRL/D
to
finish:AAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWluhnUC768EoWhyPW6FZ2t5360O5M29EpKBmGq1kQaz5V0mU9IQe66+5YyD4UxOKSDtTI+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=control-D

awplus(config)#
```

To add a public key for the user `graydon` from the file `key.pub`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey graydon key.pub
```

To add a public key for the user `tamara` from the terminal, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey tamara
```

and enter the key. Use Ctrl+D to finish.

To remove the first key entry from the public key chain of the user `john`, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto key pubkey-chain userkey john 1
```

**Related commands** [show crypto key pubkey-chain userkey](#)

# debug ssh client

**Overview** This command enables the SSH client debugging facility. When enabled, any SSH, SCP and SFTP client sessions send diagnostic messages to the login terminal.

The **no** variant of this command disables the SSH client debugging facility. This stops the SSH client from generating diagnostic debugging message.

**Syntax** `debug ssh client [brief|full]`  
`no debug ssh client`

Parameter	Description
brief	Enables brief debug mode.
full	Enables full debug mode.

**Default** SSH client debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To start SSH client debugging, use the command:

```
awplus# debug ssh client
```

To start SSH client debugging with extended output, use the command:

```
awplus# debug ssh client full
```

To disable SSH client debugging, use the command:

```
awplus# no debug ssh client
```

**Related commands** [debug ssh server](#)  
[show ssh client](#)  
[undebug ssh client](#)

# debug ssh server

**Overview** This command enables the SSH server debugging facility. When enabled, the SSH server sends diagnostic messages to the system log. To display the debugging messages on the terminal, use the **terminal monitor** command.

The **no** variant of this command disables the SSH server debugging facility. This stops the SSH server from generating diagnostic debugging messages.

**Syntax** `debug ssh server [brief|full]`  
`no debug ssh server`

Parameter	Description
brief	Enables brief debug mode.
full	Enables full debug mode.

**Default** SSH server debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To start SSH server debugging, use the command:

```
awplus# debug ssh server
```

To start SSH server debugging with extended output, use the command:

```
awplus# debug ssh server full
```

To disable SSH server debugging, use the command:

```
awplus# no debug ssh server
```

**Related commands** [debug ssh client](#)  
[show ssh server](#)  
[undebug ssh server](#)

# service ssh

**Overview** Use this command to enable the Secure Shell server on the device. Once enabled, connections coming from SSH clients are accepted.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using ECDSA with a curve length of 384, and RSA with a 1024-bit key (unless in secure mode, when it only generates the ECDSA key).

If you need a key with different parameters than this, you can use the [crypto key generate hostkey](#) command to generate that key before you enable the SSH server.

Use the **no** variant of this command to disable the Secure Shell server. When the Secure Shell server is disabled, connections from SSH, SCP, and SFTP clients are not accepted. This command does not affect existing SSH sessions. To terminate existing sessions, use the [clear ssh](#) command.

**Syntax** `service ssh [ip|ipv6]`  
`no service ssh [ip|ipv6]`

**Default** The Secure Shell server is disabled by default. Both IPv4 and IPv6 Secure Shell server are enabled when you issue **service ssh** without specifying the optional **ip** or **ipv6** parameters.

The server supports SSH version 2 only (not SSH version 1).

**Mode** Global Configuration

**Examples** To enable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh
```

To enable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ip
```

To enable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ipv6
```

To disable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh
```

To disable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ip
```

To disable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ipv6
```

changes**

Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# show banner login

**Overview** This command displays the banner message configured on the device. The banner message is displayed to the remote user before user authentication starts.

**Syntax** `show banner login`

**Mode** User Exec, Privileged Exec, Global Configuration, Interface Configuration, Line Configuration

**Example** To display the current login banner message, use the command:

```
awplus# show banner login
```

**Related commands** [banner login \(SSH\)](#)

# show crypto key hostkey

**Overview** This command displays the public keys generated on the device for the SSH server.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using ECDSA with a curve length of 384, and RSA with a 1024-bit key (unless in secure mode, when it only generates the ECDSA key).

The private key remains on the device secretly. The public key is copied to SSH clients to identify the server. This command displays the public key.

**Syntax** `show crypto key hostkey [dsa|ecdsa|rsa|rsa1]`

Parameter	Description
dsa	Displays the DSA algorithm public key.
ecdsa	Displays the ECDSA algorithm public key.
rsa	Displays the RSA algorithm public key for SSH version 2 connections.
rsa1	Displays the RSA algorithm public key for SSH version 1 connections. From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported.

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To show the public keys generated on the device for SSH server, use the command:

```
awplus# show crypto key hostkey
```

To display the RSA public key of the SSH server, use the command:

```
awplus# show crypto key hostkey rsa
```

**Output** Figure 73-1: Example output from the **show crypto key hostkey** command

```
Type Bits Fingerprint

rsa 1024 SHA256:T/sVz5OoA1HHXcov9dXzGGQg8avRUYh1psxNSUcSOvs
ecdsa 384 SHA256:qVn/KpN5X5ct5CJakxE40mPWmPvW2vIbBjF4SA2bZkM
```

**Table 1:** Parameters in output of the **show crypto key hostkey** command

Parameter	Description
Type	Algorithm used to generate the key.
Bits	Length in bits of the key.
Fingerprint	Checksum value for the public key.

**Related  
commands** [crypto key destroy hostkey](#)  
[crypto key generate hostkey](#)

# show crypto key pubkey-chain knownhosts

**Overview** This command displays the list of public keys maintained in the known host database on the device.

**Syntax** `show crypto key pubkey-chain knownhosts [<1-65535>]`

**Syntax (VRF-lite)** `show crypto key pubkey-chain knownhosts [vrf <vrf-name>|global] [<1-65535>]`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<1-65535>	Key identifier for a specific key. Displays the public key of the entry if specified.

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

**Usage** When VRF-lite is configured:

- If **vrf** is specified, this command displays the known host database from the specified VRF instance.
- If **global** is specified, this command displays the known host database from the global routing environment.
- If neither **vrf** nor **global** is specified, this command displays the known host database from the global routing environment and each configured VRF.

For more information about VRF, see the [VRF Lite Feature Overview and Configuration Guide](#).

**Examples** To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

**Output** Figure 73-2: Example output from the **show crypto key public-chain knownhosts** command

No	Hostname	Type	Fingerprint
1	172.16.23.1	rsa	c8:33:b1:fe:6f:d3:8c:81:4e:f7:2a:aa:a5:be:df:18
2	172.16.23.10	rsa	c4:79:86:65:ee:a0:1d:a5:6a:e8:fd:1d:d3:4e:37:bd
3	5ffe:1053:ac21:ff00:0101:bcdf:ffff:0001	rsa1	af:4e:b4:a2:26:24:6d:65:20:32:d9:6f:32:06:ba:57

**Table 2:** Parameters in the output of the **show crypto key public-chain knownhosts** command

Parameter	Description
No	Number ID of the key.
Hostname	Host name of the known SSH server.
Type	The algorithm used to generate the key.
Fingerprint	Checksum value for the public key.

**Related commands** [crypto key pubkey-chain knownhosts](#)

# show crypto key pubkey-chain userkey

**Overview** This command displays the public keys registered with the SSH server for SSH users. These keys allow remote users to access the device using public key authentication. By using public key authentication, users can access the SSH server without providing password.

**Syntax** `show crypto key pubkey-chain userkey <username> [<1-65535>]`

Parameter	Description
<username>	User name of the remote SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
<1-65535>	Key identifier for a specific key.

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the public keys for the user `manager` that are registered with the SSH server, use the command:

```
awplus# show crypto key pubkey-chain userkey manager
```

**Output** Figure 73-3: Example output from the **show crypto key public-chain userkey** command

No	Type	Bits	Fingerprint
1	dsa	1024	2b:cc:df:a8:f8:2e:8f:a4:a5:4f:32:ea:67:29:78:fd
2	rsa	2048	6a:ba:22:84:c1:26:42:57:2c:d7:85:c8:06:32:49:0e

**Table 3:** Parameters in the output of the **show crypto key userkey** command

Parameter	Description
No	Number ID of the key.
Type	The algorithm used to generate the key.
Bits	Length in bits of the key.
Fingerprint	Checksum value for the key.

**Related commands** [crypto key pubkey-chain userkey](#)

# show crypto key userkey

**Overview** This command displays the public keys created on this device for the specified SSH user.

**Syntax** `show crypto key userkey <username> [dsa|rsa|rsa1]`

Parameter	Description
<username>	User name of the local SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
dsa	Displays the DSA public key.
rsa	Displays the RSA public key used for SSH version 2 connections.
rsa1	Displays the RSA key used for SSH version 1 connections.

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To show the public key generated for the user, use the command:

```
awplus# show crypto key userkey manager
```

To store the RSA public key generated for the user manager to the file "user.pub", use the command:

```
awplus# show crypto key userkey manager rsa > manager-rsa.pub
```

**Output** Figure 73-4: Example output from the **show crypto key userkey** command

Type	Bits	Fingerprint
rsa	2048	e8:d6:1b:c0:f4:b6:e6:7d:02:2e:a9:d4:a1:ca:3b:11
rsa1	1024	12:25:60:95:64:08:8e:a1:8c:3c:45:1b:44:b9:33:9b

**Table 4:** Parameters in the output of the **show crypto key userkey** command

Parameter	Description
Type	The algorithm used to generate the key.
Bits	Length in bits of the key.
Fingerprint	Checksum value for the key.

# show running-config ssh

**Overview** This command displays the current running configuration of Secure Shell (SSH).

**Syntax** `show running-config ssh`

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of SSH, use the command:

```
awplus# show running-config ssh
```

**Output** Figure 73-5: Example output from the **show running-config ssh** command

```
!
ssh server session-timeout 600
ssh server login-timeout 30
ssh server allow-users manager 192.168.1.*
ssh server allow-users john
ssh server deny-user john*.a-company.com
ssh server
```

**Table 5:** Parameters in the output of the **show running-config ssh** command

Parameter	Description
<code>ssh server</code>	SSH server is enabled.
<code>ssh server v2</code>	SSH server is enabled and only support SSHv2.
<code>ssh server&lt;port&gt;</code>	SSH server is enabled and listening on the specified TCP port.
<code>no ssh server scp</code>	SCP service is disabled.
<code>no ssh server sftp</code>	SFTP service is disabled.
<code>ssh server session-timeout</code>	Configure the server session timeout.
<code>ssh server login-timeout</code>	Configure the server login timeout.
<code>ssh server max-startups</code>	Configure the maximum number of concurrent sessions waiting authentication.
<code>no ssh server authentication password</code>	Password authentication is disabled.
<code>no ssh server authentication publickey</code>	Public key authentication is disabled.

**Table 5:** Parameters in the output of the **show running-config ssh** command

Parameter	Description
ssh server allow-users	Add the user (and hostname) to the allow list.
ssh server deny-users	Add the user (and hostname) to the deny list.

**Related commands**

- service ssh
- show ssh server

# show ssh

**Overview** This command displays the active SSH sessions on the device, both incoming and outgoing.

**Syntax** `show ssh`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the current SSH sessions on the device, use the command:

```
awplus# show ssh
```

**Output** Figure 73-6: Example output from the **show ssh** command

```
Secure Shell Sessions:
ID Type Mode Peer Host Username State Filename

414 ssh server 172.16.23.1 root open
456 ssh client 172.16.23.10 manager user-auth
459 scp client 172.16.23.12 root download example.awd
463 ssh client 5ffe:33fe:5632:ffbb:bc35:ddee:0101:ac51
 manager user-auth
```

**Table 6:** Parameters in the output of the **show ssh** command

Parameter	Description
ID	Unique identifier for each SSH session.
Type	Session type; either SSH, SCP, or SFTP.
Mode	Whether the device is acting as an SSH client (client) or SSH server (server) for the specified session.
Peer Host	The hostname or IP address of the remote server or client.
Username	Login user name of the server.

**Table 6:** Parameters in the output of the **show ssh** command (cont.)

Parameter	Description	
State	The current state of the SSH session. One of:	
	connecting	The device is looking for a remote server.
	connected	The device is connected to the remote server.
	accepted	The device has accepted a new session.
	host-auth	host-to-host authentication is in progress.
	user-auth	User authentication is in progress.
	authenticated	User authentication is complete.
	open	The session is in progress.
	download	The user is downloading a file from the device.
	upload	The user is uploading a file from the device.
	closing	The user is terminating the session.
	closed	The session is closed.
Filename	Local filename of the file that the user is downloading or uploading.	

**Related commands** [clear ssh](#)

# show ssh client

**Overview** This command displays the current configuration of the Secure Shell client.

**Syntax** `show ssh client`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the current configuration for SSH clients on the login shell, use the command:

```
awplus# show ssh client
```

**Output** Figure 73-7: Example output from the **show ssh client** command

```
Secure Shell Client Configuration

Port : 22
Version : 2,1
Connect Timeout : 30 seconds
Session Timeout : 0 (off)
Debug : NONE
```

**Table 7:** Parameters in the output of the **show ssh client** command

Parameter	Description
Port	SSH server TCP port where the SSH client connects to. The default is port 22.
Version	SSH server version, either "2" or "2,1". From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported.
Connect Timeout	Time in seconds that the SSH client waits for an SSH session to establish. If the value is 0, the connection is terminated when it reaches the TCP timeout.
Debug	Whether debugging is active on the client.

**Related commands** [show ssh server](#)

# show ssh server

**Overview** This command displays the current configuration of the Secure Shell server.

Note that changes to the SSH configuration affects only new SSH sessions coming from remote hosts, and does not affect existing sessions.

**Syntax** `show ssh server`

**Mode** User Exec, Privileged Exec, and Global Configuration

**Example** To display the current configuration of the Secure Shell server, use the command:

```
awplus# show ssh server
```

**Output** Figure 73-8: Example output from the **show ssh server** command

```
Secure Shell Server Configuration

SSH Server : Disabled
Protocol : IPv4,IPv6
Port : 22
Version : 2
Services : scp, sftp
User Authentication : publickey, password
Resolve Hosts : Disabled
Session Timeout : 0 (Off)
Login Timeout : 60 seconds
Maximum Authentication Tries : 6
Maximum Startups : 10
Debug : NONE
Ciphers : aes128-cbc, aes128-ctr, aes192-ctr, aes256-ctr
KEX : curve25519-sha256@libssh.org,
 ecdh-sha2-nistp256, ecdh-sha2-nistp384,
 ecdh-sha2-nistp521,

 diffie-hellman-group-exchange-sha1,
 diffie-hellman-group14-sha1
```

**Table 8:** Parameters in the output of the **show ssh server** command

Parameter	Description
SSH Server	Whether the Secure Shell server is enabled or disabled.
Port	TCP port where the Secure Shell server listens for connections. The default is port 22.
Version	SSH server version; either '2' or '2,1'. From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported.
Services	List of the available Secure Shell services; one or more of SHELL, SCP or SFTP.

**Table 8:** Parameters in the output of the **show ssh server** command (cont.)

Parameter	Description
User Authentication	List of available authentication methods.
Login Timeout	Time (in seconds) that the SSH server will wait the SSH session to establish. If the value is 0, the client login will be terminated when TCP timeout reaches.
Idle Timeout	Time (in seconds) that the SSH server will wait to receive data from the SSH client. The server disconnects if this timer limit is reached. If set at 0, the idle timer remains off.
Maximum Startups	The maximum number of concurrent connections that are waiting authentication. The default is 10.
Debug	Whether debugging is active on the server.
Ciphers	List of current ciphers permitted.
KEX	List of available Key Exchange algorithms.

**Related commands** [show ssh](#)  
[show ssh client](#)

# show ssh server allow-users

**Overview** This command displays the user entries in the allow list of the SSH server.

**Syntax** `show ssh server allow-users`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the user entries in the allow list of the SSH server, use the command:

```
awplus# show ssh server allow-users
```

**Output** Figure 73-9: Example output from the **show ssh server allow-users** command

Username	Remote Hostname (pattern)
awplus	192.168.*
john	
manager	*.alliedtelesis.com

**Table 9:** Parameters in the output of the **show ssh server allow-users** command

Parameter	Description
Username	User name that is allowed to access the SSH server.
Remote Hostname (pattern)	IP address or hostname pattern of the remote client. The user is allowed requests from a host that matches this pattern. If no hostname is specified, the user is allowed from all hosts.

**Related commands** [ssh server allow-users](#)  
[ssh server deny-users](#)

# show ssh server deny-users

**Overview** This command displays the user entries in the deny list of the SSH server. The user in the deny list is rejected to access the SSH server. If a user is not included in the access list of the SSH server, the user is also rejected.

**Syntax** `show ssh server deny-users`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the user entries in the deny list of the SSH server, use the command:

```
awplus# show ssh server deny-users
```

**Output** Figure 73-10: Example output from the **show ssh server deny-users** command

Username	Remote Hostname (pattern)
john	*.b-company.com
manager	192.168.2.*

**Table 10:** Parameters in the output of the **show ssh server deny-user** command

Parameter	Description
Username	The user that this rule applies to.
Remote Hostname (pattern)	IP address or hostname pattern of the remote client. The user is denied requests from a host that matches this pattern. If no hostname is specified, the user is denied from all hosts.

**Related commands** [ssh server allow-users](#)  
[ssh server deny-users](#)

# ssh

**Overview** Use this command to initiate a Secure Shell connection to a remote SSH server.

If the server requests a password to login, you need to type in the correct password at the "Password:" prompt.

An SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

**NOTE:** A hostname specified with SSH cannot begin with a hyphen (-) character.

**Syntax** `ssh [ip|ipv6] [user <username>|port <1-65535>|version {1|2}] <remote-device> [<command>]`

**Syntax in secure mode** `ssh [cipher {aes128-cbc|aes256-cbc}] [hmac {hmac-sha2-256}] [public-key {ecdsa-sha2-nistp256|ecdsa-sha2-nistp384}] [key-exchange {ecdh-sha2-nistp256|ecdh-sha2-nistp384}] [ip|ipv6] [user <username>|port <1-65535>|version {1|2}] <remote-device> [<command>]`

**Syntax (VRF-lite)** If the platform supports multicast for VRFs then specifying a VRF name the command will take effect on that VRF and not specifying a VRF will do it for the global VRF.

`ssh vrf <vrf-name> [ip|ipv6] [user <username>|port <1-65535>|version {1|2}] <remote-device> [<command>]`

Parameter	Description
<code>cipher</code>	The supported cipher name. Select either: aes128-cbc or aes256-cbc.
<code>hmac</code>	The supported hmac name: hmac-sha2-256
<code>public-key</code>	The supported public-key name. Select either: ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384
<code>key-exchange</code>	The supported key-exchange name. Select either: ecdh-sha2-nistp256 or ecdh-sha2-nistp384
<code>vrf</code>	Apply the command to the specified VRF instance.
<code>&lt;vrf-name&gt;</code>	The name of the VRF instance.
<code>ip</code>	Specify IPv4 SSH.
<code>ipv6</code>	Specify IPv6 SSH.

Parameter	Description
user	<p>Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.</p> <p>&lt;username&gt;    User name to login on the remote server.</p>
port	<p>SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Otherwise, the client port configured by "ssh client" command or the default TCP port (22) is used.</p> <p>&lt;1-65535&gt;    TCP port.</p>
version	<p>SSH client version. If version is specified, the SSH client supports only the specified SSH version. By default, SSH client uses SSHv2 first. If the server does not support SSHv2, it will try SSHv1. The default version can be configured by "ssh client" command.</p> <p>1              Use SSH version 1.</p> <p>2              Use SSH version 2.</p>
<remote-device>	<p>IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character.</p>
<command>	<p>A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.</p>

**Mode**    User Exec and Privileged Exec

**Usage notes**    This command contains some additional security parameters (cipher, hmac, public-key, and key exchange). To access these parameters you must enable Secure Mode on the device by using the command: **crypto secure-mode**.

```
awplus(config)# crypto secure-mode
```

**Examples**    To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user "manager", use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening on TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server with "example\_host" using an IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

**Example (VRF-lite)** To login to the remote SSH server at 192.168.1.1 on VRF "red", use the command:

```
awplus# ssh vrf red 192.168.1.1
```

**Command changes**

Version 5.4.6-2.1: VRF-lite support added for AR-Series devices.  
Version 5.4.8-1.2: secure mode syntax added for x220, x930, x550, XS900MX.  
Version 5.4.8-2.1: secure mode syntax added for x950, SBx908 GEN2.

# ssh client

**Overview** This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the `ssh client` command, and restores the defaults.

This command does not affect the existing SSH sessions.

**Syntax**

```
ssh client {port <1-65535>|version {1|2}|session-timeout <0-3600>|connect-timeout <1-600>}
no ssh client {port|version|session-timeout|connect-timeout}
```

Parameter	Description
port	The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port. Default: 22
	<1-65535> TCP port number.
version	The SSH version used by the client for SSH sessions. The SSH client supports both version 2 and version 1 Default: version 2 Note: SSH version 2 is the default SSH version. SSH client supports SSH version 1 if SSH version 2 is not configured using a ssh version command.
	1 SSH clients on the device supports SSH version 1 only.
	2 SSH clients on the device supports SSH version 2 only
session-timeout	The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout. Default: 0 (session timer remains off)
	<0-3600> Timeout in seconds.

Parameter	Description
connect-timeout	The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established. Default: 30
	<1-600> Timeout in seconds.

**Mode** Privileged Exec

**Examples** To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

**Related commands** [show ssh client](#)  
[ssh](#)

# ssh server

**Overview** Use this command to modify the configuration of the SSH server. Changing these parameters affects new SSH sessions connecting to the device.

Use the **no** variant of this command to restore the configuration of a specified parameter to its default. The change affects the SSH server immediately if the server is running. Otherwise, the configuration is used when the server starts.

To enable the SSH server, use the [service ssh](#) command.

**Syntax**

```
ssh server {[v1v2|v2only]|<1-65535>}
ssh server {[session-timeout <0-3600>] [login-timeout <1-600>]
[max-startups <1-128>]}
no ssh server {[session-timeout] [login-timeout]
[max-startups]}
```

Parameter	Description
v1v2	Supports both SSHv2 and SSHv1 client connections. Default: v1v2
v2only	Supports SSHv2 client connections only.
<1-65535>	The TCP port number that the server listens to for incoming SSH sessions. Default: 22
session-timeout	The maximum time period that the server waits before deciding that a session is inactive and should be terminated. The server considers the session inactive when it has not received any data from the client, and when the client does not respond to keep alive messages. Default: 0 (session timer remains off). <hr/> Enter a timeout between 0-3600 seconds.
login-timeout	The maximum time period the server waits before disconnecting an unauthenticated client. Default: 60 <hr/> Enter a timeout between 1- 600 seconds.
max-startups	The maximum number of concurrent unauthenticated connections the server accepts. When the number of SSH connections awaiting authentication reaches the limit, the server drops any additional connections until authentication succeeds or the login timer expires for a connection. Default: 10 <hr/> Enter a number of sessions in the range of 1-128.

**Mode** Global Configuration

**Examples** To configure the session timer of SSH server to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server session-timeout 600
```

To configure the login timeout of SSH server to 30 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 30
```

To limit the number of SSH client connections waiting for authentication from SSH server to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-startups 3
```

To set max-startups parameters of SSH server to the default configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server max-startups
```

To support the Secure Shell server with TCP port 2200, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server 2200
```

**Related commands** [show ssh server](#)  
[ssh client](#)

**Command changes** Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# ssh server allow-users

**Overview** This command adds a username pattern to the allow list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is accepted.

When there are no registered users in the server's database of allowed users, the SSH server does not accept SSH sessions even when enabled.

SSH server also maintains the deny list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

The **no** variant of this command deletes a username pattern from the allow list of the SSH server. To delete an entry from the allow list, the username and hostname pattern should match exactly with the existing entry.

**Syntax** `ssh server allow-users <username-pattern> [<hostname-pattern>]`  
`no ssh server allow-users <username-pattern>`  
 `[<hostname-pattern>]`

Parameter	Description
<code>&lt;username-pattern&gt;</code>	The username pattern that users can match to. An asterisk acts as a wildcard character that matches any string of characters.
<code>&lt;hostname-pattern&gt;</code>	The host name pattern that hosts can match to. If specified, the server allows the user to connect only from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

**Mode** Global Configuration

**Examples** To allow the user `john` to create an SSH session from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john
```

To allow the user `john` to create an SSH session from a range of IP address (from 192.168.1.1 to 192.168.1.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john 192.168.1.*
```

To allow the user `john` to create a SSH session from `a-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john *.a-company.com
```

To delete the existing user entry `john 192.168.1.*` in the allow list, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server allow-users john 192.168.1.*
```

**Related  
commands**

[show running-config ssh](#)

[show ssh server allow-users](#)

[ssh server deny-users](#)

# ssh server authentication

**Overview** This command enables RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **ssh server authentication** command to enable password authentication for users. Apply the **publickey** keyword with the **ssh server authentication** command to enable RSA public-key authentication for users.

Use the **no** variant of this command to disable RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **no ssh authentication** command to disable password authentication for users. Apply the required **publickey** keyword with the **no ssh authentication** command to disable RSA public-key authentication for users.

**Syntax** `ssh server authentication {password|publickey}`  
`no ssh server authentication {password|publickey}`

Parameter	Description
<code>password</code>	Specifies user password authentication for SSH server.
<code>publickey</code>	Specifies user publickey authentication for SSH server.

**Default** Both RSA public-key authentication and password authentication are enabled by default.

**Mode** Global Configuration

**Usage** For password authentication to authenticate a user, password authentication for a user must be registered in the local user database or on an external RADIUS server, before using the **ssh server authentication password** command.

For RSA public-key authentication to authenticate a user, a public key must be added for the user, before using the **ssh server authentication publickey** command.

**Examples** To enable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication password
```

To enable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication publickey
```

To disable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication password
```

To disable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication publickey
```

**Related  
commands**

[crypto key pubkey-chain userkey](#)  
[service ssh](#)  
[show ssh server](#)

# ssh server deny-users

**Overview** This command adds a username pattern to the deny list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is rejected.

SSH server also maintains the allow list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

If a hostname pattern is specified, the user is denied from the hosts matching the pattern.

The **no** variant of this command deletes a username pattern from the deny list of the SSH server. To delete an entry from the deny list, the username and hostname pattern should match exactly with the existing entry.

**Syntax** `ssh server deny-users <username-pattern> [<hostname-pattern>]`  
`no ssh server deny-users <username-pattern>`  
`[<hostname-pattern>]`

Parameter	Description
<code>&lt;username-pattern&gt;</code>	The username pattern that users can match to. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen, full stop and asterisk symbols. An asterisk acts as a wildcard character that matches any string of characters.
<code>&lt;hostname-pattern&gt;</code>	The host name pattern that hosts can match to. If specified, the server denies the user only when they connect from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

**Mode** Global Configuration

**Examples** To deny the user `john` to access SSH login from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john
```

To deny the user `john` to access SSH login from a range of IP address (from 192.168.2.1 to 192.168.2.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john 192.168.2.*
```

To deny the user `john` to access SSH login from `b-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john*.b-company.com
```

To delete the existing user entry `john 192.168.2.*` in the deny list, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server deny-users john 192.168.2.*
```

**Related  
commands**

[show running-config ssh](#)

[show ssh server deny-users](#)

[ssh server allow-users](#)

# ssh server max-auth-tries

**Overview** Use this command to specify the maximum number of SSH authentication attempts that the device will allow.

Use the **no** variant of this command to return the maximum number of attempts to its default value of 6.

**Syntax** `ssh server max-auth-tries <1-32>`  
`no ssh server max-auth-tries`

Parameter	Description
<1-32>	Maximum number of SSH authentication attempts the device will allow.

**Default** 6 attempts

**Mode** Global Configuration

**Usage** By default, users must wait one second after a failed login attempt before trying again. You can increase this gap by using the command [aaa login fail-delay](#).

**Example** To set the maximum number of SSH authentication attempts to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-auth-tries 3
```

**Related commands** [show ssh server](#)

# ssh server resolve-host

**Overview** This command enables resolving an IP address from a host name using a DNS server for client host authentication.

The **no** variant of this command disables this feature.

**Syntax** `ssh server resolve-hosts`  
`no ssh server resolve-hosts`

**Default** This feature is disabled by default.

**Mode** Global Configuration

**Usage notes** Your device has a DNS Client that is enabled automatically when you add a DNS server to your device. Use the [ip name-server](#) command to add a DNS server to the list of servers that the device queries.

**Example** To resolve a host name using a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server resolve-hosts
```

**Related commands** [ip name-server](#)  
[show ssh server](#)  
[ssh server allow-users](#)  
[ssh server deny-users](#)

# ssh server scp

**Overview** This command enables the Secure Copy (SCP) service on the SSH server. Once enabled, the server accepts SCP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SCP connections. The SCP service is enabled by default as soon as the SSH server is enabled.

The **no** variant of this command disables the SCP service on the SSH server. Once disabled, SCP requests from remote clients are rejected.

**Syntax** `ssh server scp`  
`no ssh server scp`

**Mode** Global Configuration

**Examples** To enable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server scp
```

To disable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server scp
```

**Related commands** [show running-config ssh](#)  
[show ssh server](#)

# ssh server secure-ciphers

**Overview** Use this command to set the SSH server to only negotiate ciphers regarded as current-best-practice.

Use the **no** variant of this command to return to the default setting of not set.

**Syntax** `ssh server secure-ciphers`  
`no ssh server secure-ciphers`

Parameter	Description
<code>secure-ciphers</code>	Negotiate only with ciphers that are still considered current-best-practice and secure

**Default** Not set

**Mode** Global Configuration

**Usage notes** This command uses the same cipher string as the OpenSSH default, which excludes CBC, as CBC has been regarded as a weak cipher.

When the command is used, the ciphers included are:  
`chacha20-poly1305@openssh.com`, `aes128-ctr`, `aes192-ctr`, `aes256-ctr`,  
`aes128-gcm@openssh.com`, `aes256-gcm@openssh.com`

**Example** To configure the SSH server to only negotiate ciphers regarded as current best practice, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-ciphers
```

**Related commands** [show ssh server](#)

**Command changes** Version 5.5.0-1.1: command added

# ssh server secure-kex

**Overview** Use this command to specify only key exchange algorithms which are consistent with key exchange algorithms currently considered as best-current-practice to be used by the SSH server.

The algorithm list does not include diffie-hellman-group-exchange-sha1 key exchange algorithm.

Use the **no** variant of this command to disable the SSH server from using more secure key-exchange algorithms.

**Syntax** `ssh server secure-kex`  
`no ssh server secure-kex`

Parameter	Description
<code>secure-kex</code>	Use the best current practice secure key exchange (kex) list.

**Default** Disabled.

**Mode** Global Configuration

**Example** To enable the SSH server to use more secure key-exchange algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-kex
```

**Output** Figure 73-11: Example output from **show ssh server**

```
awplus#show ssh server
Secure Shell Server Cobfiguration

SSH Server : Disabled
Protocol : None
Port : 22
Version : 2
Services : scp, sftp
User Authentication : publickey, password
Resolve Hosts : Disabled

# ssh server sftp

**Overview** This command enables the Secure FTP (SFTP) service on the SSH server. Once enabled, the server accepts SFTP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SFTP connections. The SFTP service is enabled by default as soon as the SSH server is enabled. If the SSH server is disabled, SFTP service is unavailable.

The **no** variant of this command disables SFTP service on the SSH server. Once disabled, SFTP requests from remote clients are rejected.

**Syntax** `ssh server sftp`  
`no ssh server sftp`

**Mode** Global Configuration

**Examples** To enable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server sftp
```

To disable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server sftp
```

# active (trigger)

**Overview** This command enables a trigger. This allows the trigger to activate when its trigger conditions are met.

The **no** variant of this command disables a trigger. While in this state the trigger cannot activate when its trigger conditions are met.

**Syntax** active  
no active

**Default** Active, which means that triggers are enabled by default

**Mode** Trigger Configuration

**Usage notes** Configure a trigger first before you use this command to activate it.

For information about configuring a trigger, see the [Triggers\\_Feature Overview and Configuration Guide](#).

**Examples** To enable trigger 172, so that it can activate when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 172
awplus(config-trigger)# active
```

To disable trigger 182, preventing it from activating when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 182
awplus(config-trigger)# no active
```

**Related commands** [show trigger](#)  
[trigger](#)  
[trigger activate](#)

# day

**Overview** This command specifies the days or date that the trigger can activate on. You can specify one of:

- A specific date
- A specific day of the week
- A list of days of the week
- A day of any month of any year
- A day of a specific month in any year
- Every day

By default, the trigger can activate on any day.

**Syntax** `day every-day`  
`day <1-31>`  
`day <1-31> <month>`  
`day <1-31> <month> <year>`  
`day <weekday>`

Parameter	Description
<code>every-day</code>	Sets the trigger so that it can activate on any day.
<code>&lt;1-31&gt;</code>	Day of the month the trigger is permitted to activate on.
<code>&lt;month&gt;</code>	Sets the month that the trigger is permitted to activate on. Valid keywords are: <b>january, february, march, april, may, june, july, august, september, october, november, and december.</b>
<code>&lt;year&gt;</code>	Sets the year that the trigger is permitted to activate in, between 2000 and 2035.
<code>&lt;weekday&gt;</code>	Sets the days of the week that the trigger can activate on. You can specify one or more week days in a space separated list. Valid keywords are: <b>monday, tuesday, wednesday, thursday, friday, saturday, and sunday.</b>

**Default** **every-day**, so by default, the trigger can activate on any day.

**Mode** Trigger Configuration

**Usage notes** For example trigger configurations that use the **day** command, see “Restrict Internet Access” and “Turn off Power to Port LEDs” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To permit trigger 55 to activate on the 1 June 2019, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 55
awplus(config-trigger)# day 1 jun 2019
```

To permit trigger 12 to activate on Mondays, Wednesdays and Fridays, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# day monday wednesday friday
```

To permit trigger 17 to activate on the 5th day of any month, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 17
awplus(config-trigger)# day 5
```

To permit trigger 6 to activate on the 20th day of September, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# day 20 september
```

To permit trigger 14 to activate on the 1st day of each month, in any year, at 11.00am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 14
awplus(config-trigger)# day 1
awplus(config-trigger)# type time 11:00
```

**Related commands** [show trigger](#)  
[type time](#)  
[trigger](#)

**Command changes** Version 5.4.8-2.1: day of the month functionality added

# debug trigger

**Overview** This command enables trigger debugging. This generates detailed messages about how your device is processing the trigger commands and activating the triggers.

The **no** variant of this command disables trigger debugging.

**Syntax** `debug trigger`  
`no debug trigger`

**Mode** Privilege Exec

**Examples** To start trigger debugging, use the command:

```
awplus# debug trigger
```

To stop trigger debugging, use the command:

```
awplus# no trigger
```

**Related commands** [show debugging trigger](#)  
[show trigger](#)  
[test](#)  
[trigger](#)  
[undebug trigger](#)

# description (trigger)

**Overview** This command adds an optional description to help you identify the trigger. This description is displayed in show command outputs and log messages.

The **no** variant of this command removes a trigger's description. The show command outputs and log messages stop displaying a description for this trigger.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	A word or phrase that uniquely identifies this trigger or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters.

**Mode** Trigger Configuration

**Examples** To give trigger 240 the description `daily status report`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 240
awplus(config-trigger)# description daily status report
```

To remove the description from trigger 36, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 36
awplus(config-trigger)# no description
```

**Related commands** [show trigger](#)  
[test](#)  
[trigger](#)

# repeat

**Overview** This command specifies the number of times that a trigger is permitted to activate. This allows you to specify whether you want the trigger to activate:

- only the first time that the trigger conditions are met
- a limited number of times that the trigger conditions are met
- an unlimited number of times

Once the trigger has reached the limit set with this command, the trigger remains in your configuration but cannot be activated. Use the **repeat** command again to reset the trigger so that it is activated when its trigger conditions are met.

By default, triggers can activate an unlimited number of times. To reset a trigger to this default, specify either **yes** or **forever**.

**Syntax** `repeat { forever | no | once | yes | <1-4294967294> }`

Parameter	Description
<code>yes   forever</code>	The trigger repeats indefinitely, or until disabled.
<code>no   once</code>	The trigger activates only once.
<code>&lt;1-4292967294&gt;</code>	The trigger repeats the specified number of times.

**Mode** Trigger Configuration

**Examples** To allow trigger 21 to activate only once, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 21
awplus(config-trigger)# repeat no
```

To allow trigger 22 to activate an unlimited number of times whenever its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 22
awplus(config-trigger)# repeat forever
```

To allow trigger 23 to activate only the first 10 times the conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 23
awplus(config-trigger)# repeat 10
```

**Related commands** [show trigger](#)  
[trigger](#)

# script

**Overview** This command specifies one or more scripts that are to be run when the trigger activates. You can add up to five scripts to a single trigger.

The sequence in which the trigger runs the scripts is specified by the number you set before the name of the script file. One script is executed completely before the next script begins.

Scripts may be either ASH shell scripts, indicated by a **.sh** filename extension suffix, or AlliedWare Plus™ scripts, indicated by a **.scp** filename extension suffix. AlliedWare Plus™ scripts only need to be readable.

The **no** variant of this command removes one or more scripts from the trigger's script list. The scripts are identified by either their name, or by specifying their position in the script list. The **all** parameter removes all scripts from the trigger.

**Syntax** `script <1-5> {<filename>}`  
`no script {<1-5>|<filename>|all}`

Parameter	Description
<1-5>	The position of the script in execution sequence. The trigger runs the lowest numbered script first.
<filename>	The path to the script file.

**Mode** Trigger Configuration

**Examples** To configure trigger 71 to run the script `flash:/cpu_trig.sh` in position 3 when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# script 3 flash:/cpu_trig.sh
```

To configure trigger 99 to run the scripts **flash:reconfig.scp**, **flash:cpu\_trig.sh** and **flash:email.scp** in positions 2, 3 and 5 when the trigger activates, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 99
awplus(config-trigger)# script 2 flash:/reconfig.scp 3
flash:/cpu_trig.sh 5 flash:/email.scp
```

To remove the scripts 1, 3 and 4 from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script 1 3 4
```

To remove the script flash:/cpu\_trig.sh from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script flash:/cpu_trig.sh
```

To remove all the scripts from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script all
```

**Related commands** [show trigger](#)  
[trigger](#)

# show debugging trigger

**Overview** This command displays the current status for trigger utility debugging. Use this command to show when trigger debugging has been turned on or off from the [debug trigger](#) command.

**Syntax** `show debugging trigger`

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of trigger debugging, use the command:

```
awplus# show debugging trigger
```

**Output** Figure 74-1: Example output from the **show debugging trigger** command

```
awplus#debug trigger
awplus#show debugging trigger
Trigger debugging status:
 Trigger debugging is on

awplus#no debug trigger
awplus#show debugging trigger
Trigger debugging status:
 Trigger debugging is off
```

**Related commands** [debug trigger](#)

# show running-config trigger

**Overview** This command displays the current running configuration of the trigger utility.

**Syntax** `show running-config trigger`

**Mode** Privileged Exec

**Example** To display the current configuration of the trigger utility, use the command:

```
awplus# show running-config trigger
```

**Output** Figure 74-2: Example output from the **show running-config trigger** command

```
trigger 1
 type card in
trigger 2
 type card out
!
```

**Related commands** [show trigger](#)

# show trigger

**Overview** This command displays configuration and diagnostic information about the triggers configured on the device. Specify the **show trigger** command without any options to display a summary of the configuration of all triggers.

**Syntax** `show trigger [<1-250>|counter|full]`

Parameter	Description
<1-250>	Displays detailed information about a specific trigger, identified by its trigger ID.
counter	Displays statistical information about all triggers.
full	Displays detailed information about all triggers.

**Mode** Privileged Exec

**Example** To get summary information about all triggers, use the following command:

```
awplus# show trigger
```

Table 74-1: Example output from **show trigger**

```
awplus#show trigger
TR# Type & Details Name Ac Te Repeat #Scr Days/Date

001 CPU (80% any) Busy CPU Y N 5 1 smtwtfS
005 Periodic (30 min) Regular status check Y N Continuous 1 -mtwtf-
007 Memory (85% up) High mem usage Y N 8 1 smtwtfS
011 Time (00:01) Weekend access Y N Continuous 1 -----s
013 Reboot Y N Continuous 2 smtwtfS
019 Ping-poll (5 up) Connection to svr1 Y N Continuous 1 smtwtfS

```

Table 74-2: Parameters in the output of **show trigger**

Parameter	Description
TR#	Trigger identifier (ID).
Type & Details	The trigger type, followed by the trigger details in brackets.
Name	Descriptive name of the trigger configured with the <a href="#">description (trigger)</a> command.
Ac	Whether the trigger is active (Y), or inactive (N).
Te	Whether the trigger is in test mode (Y) or not (N).

Table 74-2: Parameters in the output of **show trigger** (cont.)

Parameter	Description
Repeat	Whether the trigger repeats continuously, and if not, the configured repeat count for the trigger. To see the number of times a trigger has activated, use the <b>show trigger</b> <1-250> command.
#Scr	Number of scripts associated with the trigger.
Days/Date	Days or date when the trigger may be activated. For the days options, the days are shown as a seven character string representing Sunday to Saturday. A hyphen indicates days when the trigger cannot be activated.

To display detailed information about trigger 3, use the command:

```
awplus# show trigger 3
```

Figure 74-3: Example output from **show trigger** for a specific trigger

```
awplus#show trigger 1
Trigger Configuration Details

**Table 75: Parameters in the output of show trigger full and show trigger for a specific trigger**

Parameter	Description
Trigger	The ID of the trigger.
Name	Descriptive name of the trigger.
Type and details	The trigger type and its activation conditions.
Days	The days on which the trigger is permitted to activate.

**Table 75:** Parameters in the output of **show trigger full** and **show trigger** for a specific trigger (cont.)

Parameter	Description
Date	The date on which the trigger is permitted to activate. Only displayed if configured, in which case it replaces "Days".
Active	Whether or not the trigger is permitted to activate.
Test	Whether or not the trigger is operating in diagnostic mode.
Trap	Whether or not the trigger is enabled to send SNMP traps.
Repeat	Whether the trigger repeats an unlimited number of times (Continuous) or for a set number of times. When the trigger can repeat only a set number of times, then the number of times the trigger has been activated is displayed in brackets.
Modified	The date and time of the last time that the trigger was modified.
Number of activations	Number of times the trigger has been activated since the last restart of the device.
Last activation	The date and time of the last time that the trigger was activated.
Number of scripts	How many scripts are associated with the trigger, followed by the names of the script files in the order in which they run.

To display counter information about all triggers use the command:

```
awplus# show trigger counter
```

**Figure 74-4:** Example output from **show trigger counter**

```
awplus# show trigger counter
Trigger Module Counters

Trigger activations 4
Last trigger activated 55
Time triggers activated today 0

Log triggers activated today 0

```

**Related  
commands**    active (trigger)  
                  debug trigger  
                  script  
                  trigger  
                  trigger activate

# test

**Overview** This command puts the trigger into a diagnostic mode. In this mode the trigger may activate but when it does it will not run any of the trigger's scripts. A log message will be generated to indicate when the trigger has been activated.

The **no** variant of this command takes the trigger out of diagnostic mode, restoring normal operation. When the trigger activates, the scripts associated with the trigger will be run, as normal.

**Syntax** test  
no test

**Mode** Trigger Configuration

**Usage notes** Configure a trigger first before you use this command to diagnose it. For information about configuring a trigger, see the [Triggers\\_Feature Overview and Configuration Guide](#).

**Examples** To put trigger 5 into diagnostic mode, where no scripts will be run when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# test
```

To take trigger 205 out of diagnostic mode, restoring normal operation, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no test
```

**Related commands** [show trigger](#)  
[trigger](#)

# time (trigger)

**Overview** This command specifies the time of day when the trigger is permitted to activate. The **after** parameter specifies the start of a time period that extends to midnight during which trigger may activate. By default the value of this parameter is 00:00:00 (am); that is, the trigger may activate at any time. The **before** parameter specifies the end of a time period beginning at midnight during which the trigger may activate. By default the value of this parameter is 23:59:59; that is, the trigger may activate at any time. If the value specified for **before** is later than the value specified for **after**, a time period from “after” to “before” is defined, during which the trigger may activate. This command is not applicable to time triggers ( **type time**).

The following figure illustrates how the **before** and **after** parameters operate.

**Syntax** `time {[after <hh:mm:ss>] [before <hh:mm:ss>]}`

Parameter	Description
<code>after&lt;hh:mm:ss&gt;</code>	The earliest time of day when the trigger may be activated.
<code>before&lt;hh:mm:ss&gt;</code>	The latest time of day when the trigger may be activated.

**Mode** Trigger Configuration

**Usage notes** For example trigger configurations that use the **time (trigger)** command, see “Restrict Internet Access” and “Turn off Power to Port LEDs” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To allow trigger 63 to activate between midnight and 10:30am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 63
awplus(config-trigger)# time before 10:30:00
```

To allow trigger 64 to activate between 3:45pm and midnight, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 64
awplus(config-trigger)# time after 15:45:00
```

To allow trigger 65 to activate between 10:30am and 8:15pm, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 65
awplus(config-trigger)# time after 10:30:00 before 20:15:00
```

**Related commands** [show trigger](#)  
[trigger](#)

# trap

**Overview** This command enables the specified trigger to send SNMP traps.

Use the **no** variant of this command to disable the sending of SNMP traps from the specified trigger.

**Syntax** trap  
no trap

**Default** SNMP traps are enabled by default for all defined triggers.

**Mode** Trigger Configuration

**Usage notes** You must configure SNMP before using traps with triggers. For more information, see:

- [Support for Allied Telesis Enterprise\\_MIBs\\_in\\_AlliedWare Plus](#), for information about which MIB objects are supported.
- the [SNMP Feature Overview and Configuration\\_Guide](#).
- the [SNMP Commands](#) chapter.

Since SNMP traps are enabled by default for all defined triggers, a common usage will be for the **no** variant of this command to disable SNMP traps from a specified trap if the trap is only periodic. Refer in particular to AT-TRIGGER-MIB in the [Support for Allied Telesis Enterprise\\_MIBs\\_in AlliedWare Plus](#) for further information about the relevant SNMP MIB.

**Examples** To enable SNMP traps to be sent from trigger 5, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# trap
```

To disable SNMP traps being sent from trigger 205, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no trap
```

**Related commands** [trigger](#)  
[show trigger](#)

# trigger

**Overview** This command is used to access the Trigger Configuration mode for the specified trigger. Once Trigger Configuration mode has been entered the trigger type information can be configured and the trigger scripts and other operational parameters can be specified. At a minimum the trigger type information must be specified before the trigger can become active.

The **no** variant of this command removes a specified trigger and all configuration associated with it.

**Syntax** trigger <1-250>  
no trigger <1-250>

Parameter	Description
<1-250>	A trigger ID.

**Mode** Global Configuration

**Examples** To enter trigger configuration mode for trigger 12, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
```

To completely remove all configuration associated with trigger 12, use the commands:

```
awplus# configure terminal
awplus(config)# no trigger 12
```

**Related commands** [show trigger](#)  
[trigger activate](#)

# trigger activate

**Overview** This command is used to manually activate a specified trigger from the Privileged Exec mode, which has been configured with the **trigger** command from the Global Configuration mode.

**Syntax** `trigger activate <1-250>`

Parameter	Description
<1-250>	A trigger ID.

**Mode** Privileged Exec

**Usage notes** This command manually activates a trigger without the normal trigger conditions being met.

The trigger is activated even if it has been configured as inactive by using the command **no active**. The scripts associated with the trigger will be executed even if the trigger is in the diagnostic test mode.

Triggers activated manually do not have their repeat counts decremented or their 'last triggered' time updated, and do not result in updates to the '[type] triggers today' counters.

**Example** To manually activate trigger 12 use the command:

```
awplus# trigger activate 12
```

**Related commands**

- [active \(trigger\)](#)
- [show trigger](#)
- [trigger](#)

# type atmf guest

**Overview** This command configures a trigger to activate when an AMF guest node joins or leaves.

**Syntax** `type atmf guest {join|leave}`

Parameter	Description
join	AMF guest node joins.
leave	AMF guest node leaves.

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when an AMF guest node leaves, use the following commands:

```
awplus(config)# trigger 86
awplus(config-trigger)# type atmf guest leave
```

**Related commands** [show trigger](#)

**Command changes** Version 5.5.1-1.1: command added

# type atmf node

**Overview** This command configures a trigger to activate when an AMF node joins or leaves.

**Syntax** type atmf node {join|leave}

Parameter	Description
join	AMF node joins.
leave	AMF node leaves.

**Mode** Trigger Configuration

**Example 1** To configure trigger 5 to activate when an AMF node leaves, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger)# type atmf node leave
```

**Example 2** The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

### Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=====
node1:
=====

TR# Type & Details Description Ac Te Tr Repeat #Scr Days/Date

001 Periodic (2 min) Periodic Status Chk Y N Y Continuous 1 smtwtfS
005 ATMF node (leave) E-mail on ATMF Exit Y N Y Continuous 1 smtwtfS

=====
Node2, Node3,
=====

TR# Type & Details Description Ac Te Tr Repeat #Scr Days/Date

005 ATMF node (leave) E-mail on ATMF Exit Y N Y Continuous 1 smtwtfS

```

### Display the triggers configured on each of the nodes in the AMF Network.

```
AMF-Net[3]# show running-config trigger
```

This command returns the following display:

```
=====
Node1:
=====

trigger 1
 type periodic 2
 script 1 atmf.scp
trigger 5
 type atmf node leave
description "E-mail on ATMF Exit"
 script 1 email_me.scp
!

=====
Node2, Node3:
=====

trigger 5
 type atmf node leave
description "E-mail on ATMF Exit"
 script 1 email_me.scp
!
```

**Related commands** [show trigger](#)

# type cpu

**Overview** This command configures a trigger to activate based on CPU usage level. Selecting the **up** option causes the trigger to activate when the CPU usage exceeds the specified usage level. Selecting the **down** option causes the trigger to activate when CPU usage drops below the specified usage level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

**Syntax** `type cpu <1-100> [up|down|any]`

Parameter	Description
<1-100>	The percentage of CPU usage at which to trigger.
up	Activate when CPU usage exceeds the specified level.
down	Activate when CPU usage drops below the specified level
any	Activate when CPU usage passes the specified level in either direction

**Mode** Trigger Configuration

**Usage notes** For an example trigger configuration that uses the **type cpu** command, see “Capture Unusual CPU and RAM Activity” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To configure trigger 28 to be a CPU trigger that activates when CPU usage exceeds 80% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 28
awplus(config-trigger)# type cpu 80 up
```

To configure trigger 5 to be a CPU trigger that activates when CPU usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65

or

awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65 any
```

**Related commands** [show trigger](#)  
[trigger](#)

# type interface

**Overview** This command configures a trigger to activate based on the link status of an interface. The trigger can be activated when the interface becomes operational by using the **up** option, or when the interface closes by using the **down** option. The trigger can also be configured to activate when either one of these events occurs by using the **any** option.

**Syntax** `type interface <interface> {up|down|any}`

Parameter	Description
<interface>	Interface name.
up	Activate when interface becomes operational.
down	Activate when the interface closes.
any	Activate when any interface link status event occurs.

**Mode** Trigger Configuration

**Example** To configure trigger 19 to be an interface trigger that activates when port1.0.1 becomes operational, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 19
awplus(config-trigger)# type interface port1.0.1 up
```

**Related commands** [show trigger](#)  
[trigger](#)

# type linkmon-probe

**Overview** Use this command to create a trigger that will run a script when a Link Health Monitoring probe reports that a link becomes “good”, “bad”, or “unreachable”.

**Syntax** `type linkmon-probe <probename> <profilename>  
{good|bad|unreachable|any}`

Parameter	Description
<probename>	The name of the Link Health Monitoring probe that will be used for executing the trigger.
<profilename>	The name of the Link Health Monitoring performance profile that will be used for determine if the Link Health Monitoring probe is good, bad, or unreachable.
good	If the Link Health Monitoring probe becomes 'good' according to the Link Health Monitoring performance profile then the trigger will be executed.
bad	If the Link Health Monitoring probe goes 'bad' according to the Link Health Monitoring performance profile then the trigger will be executed.
unreachable	If the Link Health Monitoring probe becomes 'unreachable' according to the Link Health Monitoring performance profile then the trigger will be executed.
any	If the Link Health Monitoring probe changes state according to the Link Health Monitoring performance profile then the trigger will be executed.

**Mode** Trigger Configuration

**Example** When the Link Health Monitoring probes sent to the “test-probe” destination no longer meet the performance profile “test-profile” the link will be deemed “bad”. To create a trigger that will run a script when a Link Health Monitoring probe is deemed “bad”, use the following commands:

```
awplus# trigger 1
awplus(config)# script 1 link-bad.scp
awplus(config)# type linkmon-probe test-probe test-profile bad
```

To create a trigger that will run a script when the link is deemed “good” again, use the following commands:

```
awplus# trigger 2
awplus(config)# script 1 link-good.scp
awplus(config)# type linkmon-probe test-probe test-profile good
```

**Related commands** [trigger](#)

**Command changes** Version 5.4.8-1.1: command added

# type log

**Overview** Use this command to configure a trigger to activate based on the content of log messages matching a string or regular expression.

**Syntax** `type log <log-message-string>`

Parameter	Description
<code>&lt;log-message-string&gt;</code>	A string or a regular expression (PCRE) to match a log message or part of a log message.

**Default** There is no type or log message string set by default.

**Mode** Trigger Configuration

**Usage notes** Log type triggers fully support regular expressions using PCRE (Perl-Compatible Regular Expression) syntax.

Only log messages of severity level notice or higher can activate a trigger.

Note that any command executed by the script will generate a log message with level notice, and will include '[SCRIPT]' before the command string. Therefore, if something in the script matches the configured log message trigger string, it will retrigger indefinitely.

**Example** To configure trigger 6 to activate when a log message of level notice or higher indicates that any port has 'failed', use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# type log port.+ failed
```

**Related commands** [show trigger](#)  
[trigger](#)

**Command changes** Version 5.4.7-2.1: command added

# type memory

**Overview** This command configures a trigger to activate based on RAM usage level. Selecting the **up** option causes the trigger to activate when memory usage exceeds the specified level. Selecting the **down** option causes the trigger to activate when memory usage drops below the specified level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

**Syntax** `type memory <1-100> [up|down|any]`

Parameter	Description
<1-100>	The percentage of memory usage at which to trigger.
up	Activate when memory usage exceeds the specified level.
down	Activate when memory usage drops below the specified level.
any	Activate when memory usage passes the specified level in either direction.

**Mode** Trigger Configuration

**Examples** To configure trigger 12 to be a memory trigger that activates when memory usage exceeds 50% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# type memory 50 up
```

To configure trigger 40 to be a memory trigger that activates when memory usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65 any
```

**Related commands** [show trigger](#)  
[trigger](#)

# type periodic

**Overview** This command configures a trigger to be activated at regular intervals. The time period between activations is specified in minutes.

**Syntax** `type periodic <1-1440>`

Parameter	Description
<code>&lt;1-1440&gt;</code>	The number of minutes between activations.

**Mode** Trigger Configuration

**Usage notes** A combined limit of 10 triggers of the type periodic and time can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or periodic
```

For an example trigger configuration that uses the **type periodic** command, see "See Daily Statistics" in the [Triggers\\_Feature Overview and Configuration Guide](#).

**Example** To configure trigger 44 to activate periodically at 10 minute intervals use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 44
awplus(config-trigger)# type periodic 10
```

**Related commands** [show trigger](#)  
[trigger](#)

# type ping-poll

**Overview** This command configures a trigger that activates when Ping Polling identifies that a target device's status has changed. This allows you to run a configuration script when a device becomes reachable or unreachable.

**Syntax** `type ping-poll <1-100> {up|down}`

Parameter	Description
<1-100>	The ping poll ID.
up	The trigger activates when ping polling detects that the target is reachable.
down	The trigger activates when ping polling detects that the target is unreachable.

**Mode** Trigger Configuration

**Example** To configure trigger 106 to activate when ping poll 12 detects that its target device is now unreachable, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 106
awplus(config-trigger)# type ping-poll 12 down
```

**Related commands** [show trigger](#)  
[trigger](#)

# type reboot

**Overview** This command configures a trigger that activates when your device is rebooted.

**Syntax** type reboot

**Mode** Trigger Configuration

**Example** To configure trigger 32 to activate when your device reboots, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 32
awplus(config-trigger)# type reboot
```

**Related commands** [show trigger](#)  
[trigger](#)

# type stack disabled-master

**Overview** This command (configured to the stack) configures a trigger to activate on a stack member if it becomes the disabled master.

A disabled master has the same configuration as the active master, but has all its links shutdown.

Although this command could activate any trigger script, the intention here is that the script will reactivate the links from their previously shutdown state, to enable the user to manage the device. An appropriate trigger script must already exist that will apply the [shutdown](#) command on the deactivated links.

**CAUTION:** *It is important that any ports that are configured as trunked ports across master and stack members are disabled at their stack member termination when operating in the fallback configuration. Otherwise, the trunked ports will not function correctly on the device that is connected downstream.*

If the [stack virtual-mac](#) command is enabled, the stack uses a virtual MAC address. The stack will always use this MAC address and the new elected master will still retain the originally configured virtual MAC address. If the **stack virtual-mac** command is disabled, the stack will use the MAC address of the current master. If the stack master fails, the stack MAC address changes to reflect the new master's MAC address. For more information about virtual MAC addresses, see the [VCStack Feature Overview and Configuration Guide](#).

**Syntax** `type stack disabled-master`

**Mode** Trigger Configuration

**Examples** To configure trigger 82 to activate on a device if it becomes the disabled master, use the following commands. These commands enter the Trigger Configuration mode for trigger 82, specify the trigger type, and then specify the script to run.

```
awplus# configure terminal
awplus(config)# trigger 82
awplus(config-trigger)# type stack disabled master
awplus(config-trigger)# script 1 flash:/disabled.scp
awplus(config-trigger)# exit
```

**Related commands**

- [stack disabled-master-monitoring](#)
- [trigger](#)
- [type stack master-fail](#)
- [type stack member](#)
- [type stack link](#)

# type stack link

**Overview** This command (configured to the stack) initiates the action of a pre-configured trigger to occur when a stacking link is either activated or deactivated.

**Syntax** `type stack link {up|down}`

Parameter	Description
up	Stack link up event
down	Stack link down event

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when the stack link down event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack link down
```

**Related commands**

- [show trigger](#)
- [trigger](#)
- [type stack master-fail](#)

# type stack master-fail

**Overview** This command (configured to the stack) initiates the action of a pre-configured trigger to occur when the stack enters the fail-over state.

**Syntax** `type stack master-fail`

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when stack master fail-over event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack master-fail
```

**Related commands**

- [stack disabled-master-monitoring](#)
- [trigger](#)
- [type stack disabled-master](#)
- [type stack member](#)
- [type stack link](#)

# type stack member

**Overview** This command (configured to the stack) initiates the action of a pre-configured trigger to occur when a device either joins or leaves the stack.

**Syntax** `type stack member {join|leave}`

Parameter	Description
join	Neighbor join event
leave	Neighbor leave event

**Mode** Trigger Configuration

**Example** To configure a pre-configured trigger number 86 to activate when a new device joins the stack.

Note that the number 86 has no particular significance: you can assign any (previously created) numbered trigger.

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack member join
```

**Related commands** [trigger](#)  
[type stack master-fail](#)  
[type stack link](#)

# type time

**Overview** This command configures a trigger that activates at a specified time of day.

**Syntax** `type time <hh:mm>`

Parameter	Description
<code>&lt;hh:mm&gt;</code>	The time to activate the trigger.

**Mode** Trigger Configuration

**Usage** A combined limit of 10 triggers of the type time and type periodic can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

**Example** To configure trigger 86 to activate at 15:53, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type time 15:53
```

**Related commands** [show trigger](#)  
[trigger](#)

# type usb

**Overview** Use this command to configure a trigger that activates on either the removal or the insertion of a USB storage device.

**Syntax** `type usb {in|out}`

Parameter	Description
in	Trigger activates on insertion of a USB storage device.
out	Trigger activates on removal of a USB storage device.

**Mode** Trigger Configuration

**Usage notes** USB triggers cannot execute script files from a USB storage device.

**Examples** To configure trigger 1 to activate on the insertion of a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type usb in
```

**Related commands** [trigger](#)  
[show running-config trigger](#)  
[show trigger](#)

# undebug trigger

**Overview** This command applies the functionality of the **no debug trigger** command.

# 75

# Ping-Polling Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Ping Polling. For more information, see the [Ping Polling Feature Overview and Configuration Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Table 75-1: The following table lists the default values when configuring a ping poll

Default	Value
Critical-interval	1 second
Description	No description
Fail-count	5
Length	32 bytes
Normal-interval	30 seconds
Sample-size	5
Source-ip	The IP address of the interface from which the ping packets are transmitted
Time-out	1 second
Up-count	30

- Command List**

# active (ping-polling)

**Overview** This command enables a ping-poll instance. The polling instance sends ICMP echo requests to the device with the IP address specified by the [ip \(ping-polling\)](#) command.

By default, polling instances are disabled. When a polling instance is enabled, it assumes that the device it is polling is unreachable.

The **no** variant of this command disables a ping-poll instance. The polling instance no longer sends ICMP echo requests to the polled device. This also resets all counters for this polling instance.

**Syntax** active  
no active

**Mode** Ping-Polling Configuration

**Examples** To activate the ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# active
```

To disable the ping-poll instance 43 and reset its counters, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no active
```

**Related commands** [debug ping-poll](#)  
[ip \(ping-polling\)](#)  
[ping-poll](#)  
[show ping-poll](#)

# clear ping-poll

**Overview** This command resets the specified ping poll, or all ping poll instances. This clears the ping counters, and changes the status of polled devices to unreachable. The polling instance changes to the polling frequency specified with the [critical-interval](#) command. The device status changes to reachable once the device responses have reached the [up-count](#).

**Syntax** `clear ping-poll {<1-100>|all}`

Parameter	Description
<1-100>	A ping poll ID number. The specified ping poll instance has its counters cleared, and the status of the device it polls is changed to unreachable.
all	Clears the counters and changes the device status of all polling instances.

**Mode** Privileged Exec

**Examples** To reset the ping poll instance 12, use the command:

```
awplus# clear ping-poll 12
```

To reset all ping poll instances, use the command:

```
awplus# clear ping-poll all
```

**Related commands** [active \(ping-polling\)](#)  
[ping-poll](#)  
[show ping-poll](#)

# critical-interval

**Overview** This command specifies the time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable.

This command enables the device to quickly observe changes in state, and should be set to a much lower value than the [normal-interval](#) command.

The **no** variant of this command sets the critical interval to the default of one second.

**Syntax** `critical-interval <1-65536>`  
`no critical-interval`

Parameter	Description
<1-65536>	Time in seconds between pings, when the device has failed to a ping, or the device is unreachable.

**Default** The default is 1 second.

**Mode** Ping-Polling Configuration

**Examples** To set the critical interval to 2 seconds for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# critical-interval 2
```

To reset the critical interval to the default of one second for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# no critical-interval
```

**Related commands**

- [fail-count](#)
- [normal-interval](#)
- [sample-size](#)
- [show ping-poll](#)
- [timeout \(ping polling\)](#)
- [up-count](#)

# debug ping-poll

**Overview** This command enables ping poll debugging for the specified ping-poll instance. This generates detailed messages about ping execution.

The **no** variant of this command disables ping-poll debugging for the specified ping-poll.

**Syntax** `debug ping-poll <1-100>`  
`no debug ping-poll {<1-100>|all}`

Parameter	Description
<1-100>	A unique ping poll ID number.
all	Turn off all ping-poll debugging.

**Mode** Privileged Exec

**Examples** To enable debugging for ping-poll instance 88, use the command:

```
awplus# debug ping-poll 88
```

To disable all ping poll debugging, use the command:

```
awplus# no debug ping-poll all
```

To disable debugging for ping-poll instance 88, use the command:

```
awplus# no debug ping-poll 88
```

**Related commands**

- [active \(ping-polling\)](#)
- [clear ping-poll](#)
- [ping-poll](#)
- [show ping-poll](#)
- [undebug ping-poll](#)

# description (ping-polling)

**Overview** This command specifies a string to describe the ping-polling instance. This allows the ping-polling instance to be recognized easily in show commands. Setting this command is optional.

By default ping-poll instances do not have a description.

Use the **no** variant of this command to delete the description set.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	The description of the target. Valid characters are any printable character and spaces. There is no maximum character length.

**Mode** Ping-Polling Configuration

**Examples** To add the text "Primary Gateway" to describe the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# description Primary Gateway
```

To delete the description set for the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no description
```

**Related commands** [ping-poll](#)  
[show ping-poll](#)

# fail-count

**Overview** This command specifies the number of pings that must be unanswered, within the total number of pings specified by the [sample-size](#) command, for the ping-polling instance to consider the device unreachable.

If the number set by the [sample-size](#) command and the **fail-count** commands are the same, then the unanswered pings must be consecutive. If the number set by the [sample-size](#) command is greater than the number set by the **fail-count** command, then a device that does not always reply to pings may be declared unreachable.

The **no** variant of this command resets the fail count to the default.

**Syntax** `fail-count <1-100>`  
`no fail-count`

Parameter	Description
<code>&lt;1-100&gt;</code>	The number of pings within the sample size that a reachable device must fail to respond to before it is classified as unreachable.

**Default** The default is 5.

**Mode** Ping-Polling Configuration

**Examples** To specify the number of pings that must fail within the sample size to determine that a device is unreachable for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# fail-count 5
```

To reset the fail-count to its default of 5 for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no fail-count
```

**Related commands**

- [critical-interval](#)
- [normal-interval](#)
- [ping-poll](#)
- [sample-size](#)
- [show ping-poll](#)
- [timeout \(ping polling\)](#)
- [up-count](#)

# ip (ping-polling)

**Overview** This command specifies the IPv4 address of the device you are polling.

**Syntax** `ip {<ip-address>|<ipv6-address>}`

Parameter	Description
<code>&lt;ip-address&gt;</code>	An IPv4 address in dotted decimal notation A.B.C.D
<code>&lt;ipv6-address&gt;</code>	An IPv6 address in hexadecimal notation X:X::X:X

**Mode** Ping-Polling Configuration

**Examples** To set ping-poll instance 5 to poll the device with the IP address 192.168.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 5
awplus(config-ping-poll)# ip 192.168.0.1
```

To set ping-poll instance 10 to poll the device with the IPv6 address 2001:db8::, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 10
awplus(config-ping-poll)# ip 2001:db8::
```

**Related commands**

- [ping-poll](#)
- [source-ip](#)
- [show ping-poll](#)

# length (ping-poll data)

**Overview** This command specifies the number of data bytes to include in the data portion of the ping packet. This allows you to set the ping packets to a larger size if you find that larger packet types in your network are not reaching the polled device, while smaller packets are getting through. This encourages the polling instance to change the device's status to unreachable when the network is dropping packets of the size you are interested in.

The **no** variant of this command resets the data bytes to the default of 32 bytes.

**Syntax** `length <4-1500>`  
`no length`

Parameter	Description
<code>&lt;4-1500&gt;</code>	The number of data bytes to include in the data portion of the ping packet.

**Default** The default is 32.

**Mode** Ping-Polling Configuration

**Examples** To specify that ping-poll instance 12 sends ping packet with a data portion of 56 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length 56
```

To reset the number of data bytes in the ping packet to the default of 32 bytes for ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length
```

**Related commands** [ping-poll](#)  
[show ping-poll](#)

# normal-interval

**Overview** This command specifies the time period between pings when the device is reachable.

The **no** variant of this command resets the time period to the default of 30 seconds.

**Syntax** `normal-interval <1-65536>`  
`no normal-interval`

Parameter	Description
<code>&lt;1-65536&gt;</code>	Time in seconds between pings when the target is reachable.

**Default** The default is 30 seconds.

**Mode** Ping-Polling Configuration

**Examples** To specify a time period of 60 seconds between pings when the device is reachable for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# normal-interval 60
```

To reset the interval to the default of 30 seconds for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no normal-interval
```

**Related commands**

- [critical-interval](#)
- [fail-count](#)
- [ping-poll](#)
- [sample-size](#)
- [show ping-poll](#)
- [timeout \(ping polling\)](#)
- [up-count](#)

# ping-poll

**Overview** This command enters the ping-poll configuration mode. If a ping-poll exists with the specified number, then this command enters its configuration mode. If no ping-poll exists with the specified number, then this command creates a new ping poll with this ID number.

To configure a ping-poll, create a ping poll using this command, and use the [ip \(ping-polling\)](#) command to specify the device you want the polling instance to poll. It is not necessary to specify any further commands unless you want to change a command's default.

The **no** variant of this command deletes the specified ping poll.

**Syntax** `ping-poll <1-100>`  
`no ping-poll <1-100>`

Parameter	Description
<1-100>	A unique ping poll ID number.

**Mode** Global Configuration

**Examples** To create ping-poll instance 3 and enter ping-poll configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 3
awplus(config-ping-poll)#
```

To delete ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# no ping-poll 3
```

**Related commands**

- [clear ping-poll](#)
- [debug ping-poll](#)
- [description \(ping-polling\)](#)
- [ip \(ping-polling\)](#)
- [length \(ping-poll data\)](#)
- [show ping-poll](#)
- [source-ip](#)

# sample-size

**Overview** This command sets the total number of pings that the polling instance inspects when determining whether a device is unreachable. If the number of pings specified by the **fail-count** command go unanswered within the inspected sample, then the device is declared unreachable.

If the numbers set in this command and **fail-count** command are the same, the unanswered pings must be consecutive. If the number set by this command is greater than that set with the **fail-count** command, a device that does not always reply to pings may be declared unreachable.

You cannot set this command's value lower than the **fail-count** value.

The polling instance uses the number of pings specified by the **up-count** command to determine when a device is reachable.

The **no** variant of this command resets this command to the default.

**Syntax** `sample-size <1-100>`  
`no sample size`

Parameter	Description
<1-100>	Number of pings that determines critical and up counts.

**Default** The default is 5.

**Mode** Ping-Polling Configuration

**Examples** To set the sample-size to 50 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# sample-size 50
```

To reset sample-size to the default of 5 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no sample-size
```

**Related  
commands**

# show counter ping-poll

**Overview** This command displays the counters for ping polling.

**Syntax** show counter ping-poll [*<1-100>*]

Parameter	Description
<i>&lt;1-100&gt;</i>	A unique ping poll ID number. This displays the counters for the specified ping poll only. If you do not specify a ping poll, then this command displays counters for all ping polls.

**Mode** User Exec and Privileged Exec

**Output** Figure 75-1: Example output from the **show counter ping-poll** command

```
Ping-polling counters
Ping-poll: 1
PingsSent 15
PingsFailedUpState 0
PingsFailedDownState 0
ErrorSendingPing 2
CurrentUpCount 13
CurrentFailCount 0
UpStateEntered 0
DownStateEntered 0

Ping-poll: 2
PingsSent 15
PingsFailedUpState 0
PingsFailedDownState 0
ErrorSendingPing 2
CurrentUpCount 13
CurrentFailCount 0
UpStateEntered 0
DownStateEntered 0

Ping-poll: 5
PingsSent 13
PingsFailedUpState 0
PingsFailedDownState 2
ErrorSendingPing 2
CurrentUpCount 9
CurrentFailCount 0
UpStateEntered 0
DownStateEntered 0
```

**Table 76:** Parameters in output of the **show counter ping-poll** command

Parameter	Description
Ping-poll	The ID number of the polling instance.
PingsSent	The total number of pings generated by the polling instance.
PingsFailedUpState	The number of unanswered pings while the target device is in the Up state. This is a cumulative counter for multiple occurrences of the Up state.
PingsFailedDownState	Number of unanswered pings while the target device is in the Down state. This is a cumulative counter for multiple occurrences of the Down state.
ErrorSendingPing	The number of pings that were not successfully sent to the target device. This error can occur when your device does not have a route to the destination.
CurrentUpCount	The current number of sequential ping replies.
CurrentFailCount	The number of ping requests that have not received a ping reply in the current sample-size window.
UpStateEntered	Number of times the target device has entered the Up state.
DownStateEntered	Number of times the target device has entered the Down state.

**Example** To display counters for the polling instances, use the command:

```
awplus# show counter ping-poll
```

**Related commands**

- [debug ping-poll](#)
- [ping-poll](#)
- [show ping-poll](#)

# show ping-poll

**Overview** This command displays the settings and status of ping polls.

**Syntax** `show ping-poll [<1-100>|state {up|down}] [brief]`

Parameter	Description	
<1-100>	Displays settings and status for the specified polling instance.	
state	Displays polling instances based on whether the device they are polling is currently reachable or unreachable.	
	up	Displays polling instance where the device state is reachable.
	down	Displays polling instances where the device state is unreachable.
brief	Displays a summary of the state of ping polls, and the devices they are polling.	

**Mode** User Exec and Privileged Exec

**Output** Figure 75-2: Example output from the **show ping-poll brief** command

```
Ping Poll Configuration

Id Enabled State Destination

1 Yes Down 192.168.0.1
2 Yes Up 192.168.0.100
```

**Table 77:** Parameters in output of the **show ping-poll brief** command

Parameter	Meaning
Id	The ID number of the polling instance, set when creating the polling instance with the <a href="#">ping-poll</a> command.
Enabled	Whether the polling instance is enabled or disabled.

**Table 77:** Parameters in output of the **show ping-poll brief** command (cont.)

Parameter	Meaning
State	The current status of the device being polled:
Up	The device is reachable.
Down	The device is unreachable.
Critical Up	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.
Critical Down	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.
Destination	The IP address of the polled device, set with the <code>ip (ping-polling)</code> command.

**Figure 75-3:** Example output from the **show ping-poll** command

```

Ping Poll Configuration

Poll 1:
Description : Primary Gateway
Destination IP address : 192.168.0.1
Status : Down
Enabled : Yes
Source IP address : 192.168.0.10
Critical interval : 1
Normal interval : 30
Fail count : 10
Up count : 5
Sample size : 50
Length : 32
Timeout : 1
Debugging : Enabled

```

```

Poll 2:
Description : Secondary Gateway
Destination IP address : 192.168.0.100
Status : Up
Enabled : Yes
Source IP address : Default
Critical interval : 5
Normal interval : 60
Fail count : 20
Up count : 30
Sample size : 100
Length : 56
Timeout : 2
Debugging : Enabled

```

**Table 78:** Parameters in output of the **show ping-poll** command

Parameter	Description	
Description	Optional description set for the polling instance with the <a href="#">description (ping-polling)</a> command.	
Destination IP address	The IP address of the polled device, set with the <a href="#">ip (ping-polling)</a> command.	
Status	The current status of the device being polled:	
	Up	The device is reachable.
	Down	The device is unreachable.
	Critical Up	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.
	Critical Down	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.
Enabled	Whether the polling instance is enabled or disabled. The <a href="#">active (ping-polling)</a> and <a href="#">active (ping-polling)</a> commands enable and disable a polling instance.	
Source IP address	The source IP address sent in the ping packets. This is set using the <a href="#">source-ip</a> command.	
Critical interval	The time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable. This is set with the <a href="#">critical-interval</a> command.	
Normal interval	The time period between pings when the device is reachable. This is set with the <a href="#">normal-interval</a> command.	

**Table 78:** Parameters in output of the **show ping-poll** command (cont.)

Parameter	Description
Fail count	The number of pings that must be unanswered, within the total number of pings specified by the <a href="#">sample-size</a> command, for the polling instance to consider the device unreachable. This is set using the <a href="#">fail-count</a> command.
Up count	The number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again. This is set using the <a href="#">up-count</a> command.
Sample size	The total number of pings that the polling instance inspects when determining whether a device is unreachable. This is set using the <a href="#">sample-size</a> command.
Length	The number of data bytes to include in the data portion of the ping packet. This is set using the <a href="#">length (ping-poll data)</a> command.
Timeout	The time in seconds that the polling instance waits for a response to a ping packet. This is set using the <a href="#">timeout (ping polling)</a> command.
Debugging	Indicates whether ping polling debugging is <b>Enabled</b> or <b>Disabled</b> . This is set using the <a href="#">debug ping-poll</a> command.

**Examples** To display the ping poll settings and the status of all the polls, use the command:

```
awplus# show ping-poll
```

To display a summary of the ping poll settings, use the command:

```
awplus# show ping-poll brief
```

To display the settings for ping poll 6, use the command:

```
awplus# show ping-poll 6
```

To display a summary of the state of ping poll 6, use the command:

```
awplus# show ping-poll 6 brief
```

To display the settings of ping polls that have reachable devices, use the command:

```
awplus# show ping-poll state up
```

To display a summary of ping polls that have unreachable devices, use the command:

```
awplus# show ping-poll state down brief
```

**Related commands** [debug ping-poll](#)  
[ping-poll](#)

# source-ip

**Overview** This command specifies the source IP address to use in ping packets.

By default, the polling instance uses the address of the interface through which it transmits the ping packets. It uses the device's local interface IP address when it is set. Otherwise, the IP address of the interface through which it transmits the ping packets is used.

The **no** variant of this command resets the source IP in the packets to the device's local interface IP address.

**Syntax** `source-ip {<ip-address>|<ipv6-address>}`  
`no source-ip`

Parameter	Description
<code>&lt;ip-address&gt;</code>	An IPv4 address in dotted decimal notation A.B.C.D
<code>&lt;ipv6-address&gt;</code>	An IPv6 address in hexadecimal notation X:X::X:X

**Mode** Ping-Polling Configuration

**Examples** To configure the ping-polling instance 43 to use the source IP address 192.168.0.1 in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 192.168.0.1
```

To configure the ping-polling instance 43 to use the source IPv6 address 2001:db8:: in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 2001:db8::
```

To reset the source IP address to the device's local interface IP address for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no source-ip
```

**Related commands**

- description (ping-polling)
- ip (ping-polling)
- length (ping-poll data)
- ping-poll
- show ping-poll

# timeout (ping polling)

**Overview** This command specifies the time in seconds that the polling instance waits for a response to a ping packet. You may find a higher time-out useful in networks where ping packets have a low priority.

The **no** variant of this command resets the set time out to the default of one second.

**Syntax** `timeout <1-30>`  
`no timeout`

Parameter	Description
<1-30>	Length of time, in seconds, that the polling instance waits for a response from the polled device.

**Default** The default is 1 second.

**Mode** Ping-Polling Configuration

**Examples** To specify the timeout as 5 seconds for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# timeout 5
```

To reset the timeout to its default of 1 second for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no timeout
```

- [critical-interval](#)
- [fail-count](#)
- [normal-interval](#)
- [ping-poll](#)
- [sample-size](#)
- [show ping-poll](#)
- [up-count](#)

# up-count

**Overview** This command sets the number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again.

The **no** variant of this command resets the up count to the default of 30.

**Syntax** `up-count <1-100>`  
`no up-count`

Parameter	Description
<code>&lt;1-100&gt;</code>	Number of replied pings before an unreachable device is classified as reachable.

**Default** The default is 30.

**Mode** Ping-Polling Configuration

**Examples** To set the upcount to 5 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# up-count 5
```

To reset the upcount to the default value of 30 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no up-count
```

# debug sflow

**Overview** This command enables sFlow® debug message logging, for sFlow sampling and polling activity on the specified ports. If no ports are specified, sampling and/or polling debug messages are enabled for all ports.

The **no** variant of this command disables sFlow sampling and or polling debug message logging on the ports selected. If no ports are specified, sampling and/or polling debug messages are disabled on all ports.

**Syntax** `debug sflow [interface <port-list>] [sampling][polling]`  
`no debug sflow [interface <port-list>] [sampling][polling]`

Parameter	Description
interface	Interface information.
<port-list>	The ports for which sFlow debug is to be enabled. The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.12)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.24</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.1-1.0.24.</li></ul>
sampling	Debug sFlow sampling for the specified port(s).
polling	Debug sFlow polling for the specified port(s).

**Default** The sFlow sampling and or polling debug is disabled.

**Mode** Privileged Exec

**Examples** To enable sFlow debug message logging for polling and sampling on port1.0.1 and port1.0.7, use the commands:

```
awplus# debug sflow interface port1.0.1,port1.0.7 sampling
polling
```

To enable logging and polling of sFlow debug messages for polling and sampling on all ports, use the command:

```
awplus# debug sflow sampling polling
```

**Related commands** [show debugging sflow](#)  
[no debug all](#)

# debug sflow agent

**Overview** This command enables sFlow® debug message logging that is not specific to particular ports. For example, sending an sFlow datagram to the collector.

The **no** variant of this command applies the command default.

**Syntax** `debug sflow agent`  
`no debug sflow agent`

**Default** The sFlow agent debug message logging (that is not port specific) is disabled.

**Mode** Privileged Exec

**Example** To enable logging of sFlow agent debug messages, use the following command:

```
awplus# debug sflow agent
```

**Related commands** [show debugging sflow](#)  
[debug sflow](#)

# sflow agent

**Overview** This command sets the sFlow® agent IP address on the switch. This address is inserted into every sFlow datagram sent from the sFlow agent switch to the sFlow collector device. The sFlow collector can then use this address to uniquely identify and to access the switch, such as for SNMP. We therefore recommend that you change this address as little as possible.

Although the agent address can be set to any valid IPv4 or IPv6 address; we recommend that you set the sFlow® agent IP address to be the **local address** that is configured on the switch. For information on local addresses and how to set them up, see the [interface \(to configure\)](#) command. This ensures that the sFlow collector can maintain connectivity to the switch irrespective of the addition or deletion of VLAN interfaces (each of which will have its own specific IP address). Note that sFlow is rendered inactive whenever the agent address is not set.

The **no** variant of this command applies its default setting to remove a configured address.

**Syntax** `sflow agent {ip <ip-address>|ipv6 <ipv6-address>}`  
`no sflow agent {ip|ipv6}`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The IPv4 address of the switch that is acting as the sFlow agent.
<code>&lt;ipv6-address&gt;</code>	The IPv6 address of the switch that is acting as the sFlow agent. The IPv6 address uses the format X:X::X:X.

**Default** The sFlow agent address is unset.

**Mode** Global Configuration

**Examples** To set the sFlow agent (IPv4) address to 192.0.2.23, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ip 192.0.2.23
```

To remove the sFlow agent (IPv4) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ip
```

To set the sFlow agent (IPv6) address to 2001:0db8::1, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ipv6 2001:0db8::1
```

To remove the sFlow agent (IPv6) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ipv6
```

**Related commands** `show running-config sflow`  
`show sflow`

# sflow collector

**Overview** This command has been deprecated. It has been replaced by the [sflow collector id](#) command.

This command sets the sFlow® agent's collector IP address and/or UDP port.

**Command changes** Version 5.5.1-1.1: command deprecated.

# sflow collector id

**Overview** Use this command to set the sFlow® agent's collector IP address and optionally the port and maximum datagram size. This is the destination IP address and UDP port, for sFlow datagrams sent from the sFlow agent. The IP address can be any valid IPv4 or IPv6 address.

Use the **no** variant of this command to remove the configuration for that collector and render it inactive.

**Syntax**

```
sflow collector id <1-5> ip <ip-address> [port
<1-65535>|max-datagram-size <200-1500>]

sflow collector id <1-5> ipv6 <ipv6-address> [port
<1-65535>|max-datagram-size <200-1500>]

no sflow collector id <1-5>
```

Parameter	Description
<ip-address>	IPv4 address of the remote sFlow collector.
<ipv6-address>	IPv6 address of remote sFlow collector. The IPv6 address uses the format X::X:X.
port	Destination UDP port for sFlow datagrams sent to the collector.
<1-65535>	UDP port number (default: 6343).
max-datagram-size	The maximum number of bytes that can be sent in an sFlow datagram sent from the agent to the collector.
<200-1500>	The value set for the max-datagram-size.

**Default** By default the collector does not exist until configured with a valid IP address.

**Mode** Global Configuration

**Examples** To set the address of collector 1 to 192.168.1.36 with default port and max-datagram size, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 1 ip 192.168.1.36
```

To set the address of collector 2 to 12ae::213d::213d::333f and use UDP port 500, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 2 ipv6
12ae::213d::213d::333f port 500
```

To set the address of collector 5 to 10.42.2.70 and use UDP port 7777 and have a max-datagram-size of 800, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 5 ip 10.42.2.70 port 7777
max-datagram-size 800
```

To delete collector 5, use the commands:

```
awplus# configure terminal
awplus(config)# no sflow collector id 5
```

**Related commands** [show running-config sflow](#)  
[show sflow](#)

**Command changes** Version 5.5.1-1.1: command added.

# sflow collector max-datagram-size

**Overview** This command has been deprecated. It has been replaced by the [sflow collector id](#) command.

This command sets the maximum size of the sFlow® datagrams sent to the collector.

**Command changes** Version 5.5.1-1.1: command deprecated

# sflow enable

**Overview** This command enables sFlow® globally on the switch.

The **no** variant of this command disables sFlow globally on the switch.

Note that enabling sFlow does not automatically set its operational status to active. To activate sFlow the following conditions need to be met:

- sFlow is enabled.
- The sFlow agent address is set.
- The sFlow collector address is set to a valid (non zero) IPv4 or IPv6 address.
- Polling or sampling is enabled on the ports to be sampled or polled.

**Syntax** sflow enable  
no sflow enable

**Default** sFlow is disabled globally on the switch.

**Mode** Global Configuration

**Example** To enable sFlow operation, use the command:

```
awplus# configure terminal
awplus(config)# sflow enable
```

**Related commands** [show running-config sflow](#)  
[show sflow](#)

# sflow max-header-size

**Overview** This command sets the maximum header size of the Ethernet frames sampled on a specified port. The maximum header size is measured in bytes, referenced from the first byte of the Ethernet destination address and excludes the Ethernet FCS fields.

If a sampled Ethernet frame is longer than the maximum header size set by this command, then the frame will be truncated to the first N bytes before being placed in the sFlow datagram, where N is the maximum header size set by this command.

The **no** variant of this command resets the max-header-size to its default.

**Syntax** `sflow max-header-size <14-200>`  
`no sflow max-header-size`

Parameter	Description
<14-200>	The maximum number of header bytes to be sampled.

**Default** The max-header-size is 128 bytes.

**Mode** Interface Configuration

**Usage notes** The header size is measured from the first byte of the Ethernet frame MAC Destination Address.

- For an environment using standard TCP IPv4 over Ethernet frames, consider the following basic protocol structure:

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv4 header = 24 bytes

TCP header = 24 bytes

Total = 66 bytes

**CAUTION:** For IPv4, any data existing between 66 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to 128-66=62 bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.

For more information, see the [sFlow Feature Overview and Configuration Guide](#).

- A similar consideration can be made for an environment using TCP IPv6 over Ethernet:

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv6 header = 40 bytes

TCP header = 24 bytes

Total = 82 bytes

**CAUTION:** For IPv6, any data existing between 82 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to  $128-82=46$  bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.

Note that the agent-to-collector datagrams contain their own UDP headers, which are outside this calculation.

**Example** To set the maximum header size to 160 bytes for ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# sflow max-header-size 160
```

**Related commands**

# sflow polling-interval

**Overview** This command sets the sFlow® counter polling interval (in seconds) for the specified ports. A value of 0 disables polling. A counter sample is taken every N seconds where N is the value set by this command.

The **no** variant of this command applies the default.

**Syntax** `sflow polling-interval {0|<1-16777215>}`  
`no sflow polling-interval`

Parameter	Description
0	Disable polling (the default).
<1-16777215>	The polling interval in seconds.

**Default** The polling-interval is 0 (polling disabled).

**Mode** Interface Configuration

**Example** To set the polling interval to 60 seconds for ports 1.0.1 and 1.0.7, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# sflow polling-interval 60
```

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# sflow sampling-rate

**Overview** This command sets the mean sFlow® sampling rate for the specified ports. Sampling occurs every N frames (on average), where N is the rate value set via this command. The sampling rate applies to ingress and egress frames independently. For example, a value of 1000 will sample one frame in every 1000 frames received, i.e. one in every 1000 frames sent from the specified port. A value of 0 disables sampling on the specified port(s).

The **no** variant of this command applies the default.

**Syntax** `sflow sampling-rate <256-16777215>`  
`no sflow sampling-rate`

Parameter	Description
<256-16777215>	The sampling rate N, measured in Ethernet frames.

**Default** The sampling-rate is 0 (sampling disabled).

**Mode** Interface Configuration

**Example** To set the sampling rate to 500 for port1.0.1 and port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.3
awplus(config-if)# sflow sampling-rate 500
```

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# show debugging sflow

**Overview** This command displays sFlow® debug settings for agent operation, and for sampling and polling on specific interface ports. If no interface ports are specified, sampling and polling will be applied to all ports.

**Syntax** `show debugging sflow [interface <port-list>]`

Parameter	Description
<code>interface</code>	The interface information.
<code>&lt;port-list&gt;</code>	The ports for which the sFlow debug settings are to be shown. The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. <code>port1.0.6</code>)</li><li>• a continuous range of ports separated by a hyphen, e.g. <code>port1.0.1-1.0.6</code></li><li>• a comma-separated list of ports and port ranges, e.g. <code>port1.0.1,port1.0.3-1.0.6</code>.</li></ul>

**Mode** User Exec and Privileged Exec

**Example** To display sFlow debug settings on the agent, and for sampling and polling on ports 1.0.1 to 1.0.9, use the command:

```
awplus# show debugging sflow interface port1.0.1-1.0.9
```

**Output** Figure 76-1: Sample obtained for an sFlow agent

```
awplus# show debugging sflow interface port1.0.1-1.0.9
```

Port	Sampling Debug	Polling Debug
1.0.1	Enabled	Enabled
1.0.2	Enabled	-
1.0.3	-	-
1.0.4	-	-
1.0.5	-	-
1.0.6	-	Enabled
1.0.7	-	-
1.0.8	-	Enabled
1.0.9	-	Enabled

To display sFlow debug settings for all ports, use the command:

```
awplus# show debugging sflow
```

**Related  
commands** [show running-config sflow](#)  
[show sflow interface](#)

# show running-config sflow

**Overview** This command displays the running system information specific to the sFlow feature.

**Syntax** show running-config sflow

**Mode** Privileged Exec and Global Configuration

**Example** To display the sFlow running configuration information, use the command:

```
awplus# show running-config sflow
```

**Output** Figure 76-2: Example output from the **show running-config sflow** command

```
awplus#sh run sflow
!
sflow agent ip 192.0.2.33
sflow collector ip 192.0.2.65
sflow collector max-datagram-size 1200
sflow enable
!
interface port1.0.11-port1.0.22
 sflow sampling-rate 512
```

**Related commands** [show running-config](#)

# show sflow

**Overview** This command displays non-port-specific sFlow agent configuration and operational status.

**Syntax** show sflow

**Mode** Privileged Exec

**Example** To display sFlow configuration and operational status, use the command:

```
awplus# show sflow
```

## Output

**Table 1:** Example output from the **show sflow** command

sFlow Agent Configuration:	Default Values
sFlow Admin Status .....	Disabled [Disabled]
sFlow Agent Address .....	[not set] [not set]
Collector Address .....	0.0.0.0 [0.0.0.0]
Collector UDP Port .....	6343 [6343]
Tx Max Datagram Size .....	1200 [1400]
sFlow Agent Status:	
Polling/sampling/Tx .....	Inactive because:
	- sFlow is disabled
	- Agent Addr is not set
	- Collector Addr is 0.0.0.0
	- Polling & sampling disabled on all ports

**Table 2:** Parameters in the output of the **show sflow** command

Output Parameter	Description
sFlow Admin Status	Whether sFlow agent operation is administratively enabled.
sFlow Agent Address	The sFlow agent IPv4 or IPv6 address for the device. sFlow is rendered inactive whenever the agent address is not set.
Collector Address	The IPv4 or IPv6 collector address to which sFlow datagrams are sent. sFlow is rendered inactive whenever the collector address is set to 0.0.0.0 or 0:0::0.0.
Collector UDP Port	The UDP port on the collector to which sFlow datagrams are sent.

**Table 2:** Parameters in the output of the **show sflow** command (cont.)

Output Parameter	Description
Tx Max Datagram Size	The maximum size of the sFlow datagrams sent to the collector.
Polling/sampling/Tx	Whether sFlow sampling and/or polling (and hence sFlow datagram transmission) are active. If inactive the reasons are listed.

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# show sflow interface

**Overview** This command displays sFlow agent sampling and polling configuration for all ports or a specified port.

**Syntax** `show sflow interface [<ifrang>]`

Parameter	Description
<ifrang>	The interface range.

**Mode** Privileged Exec

**Example** To display the sFlow sampling and polling configuration for port port1.0.1, use the command:

```
awplus# show sflow interface port1.0.1
```

**Output** Figure 76-3: Example output from the **show sflow interface** command

```
awplus#show sflow interface

sFlow Port Configuration:
 Default Values:
 Sampling Rate 0 pkts (= disabled)
 Max Sample Header Size .. 128 bytes
 Polling Interval 0 secs (= disabled)

 Sampling Max Header Polling
 Rate Size Interval
Port (1 in N pkts) (bytes) (secs)

port1.0.1 0 128 0
port1.0.2 0 128 0
port1.0.3 0 128 0
...
```

# undebug sflow

**Overview** This command applies the functionality of the **no** variant of the [debug sflow](#) command.

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure MODBUS (Modicon Communication Bus).

MODBUS is a serial communications protocol for client-server communication between a switch (server) and a device in the network running MODBUS client software (client). You can use MODBUS to connect a computer to a remote terminal unit (RTU) in supervisory control and data acquisition (SCADA) systems.

The MODBUS feature allows AlliedWare Plus™ devices to be used for some SCADA processes - such as gathering sensor and alarm information and to control and monitor the state of ports and their PoE state.

The device encapsulates a request or response message in a MODBUS TCP application data unit (ADU). A client sends a message to a TCP port on the switch. The default port number is 502.

For more information, see the [MODBUS Feature Overview and Configuration Guide](#).

# clear scada modbus tcp server connection

**Overview** Use this command to forcefully disconnect a MODBUS client that is currently connected to the MODBUS TCP server.

**Syntax** `clear scada modbus tcp server connection <ip-address> <1-65535>`

Parameter	Description
<ip-address>	The IPv4 or IPv6 address of the MODBUS TCP server.
<1-65535>	The port ID number.

**Mode** Privileged Exec

**Example** To forcefully disconnect a client from the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# clear scada modbus tcp server connection
198.51.100.200 33229
```

- Version 5.5.0-1.1: MODBUS support added for IE510 series

# clear scada modbus tcp server statistics

**Overview** Use this command to reset the MODBUS TCP server statistics.

**Syntax** `clear scada modbus tcp server statistics`

**Mode** Privileged Exec

**Example** To clear the MODBUS TCP server statistics, use the following commands:

```
awplus# configure terminal
awplus(config)# clear scada modbus tcp server statistics
```

**Related commands**

- Version 5.5.0-1.1: MODBUS support added for IE510 series

# scada modbus tcp server access

**Overview** Use this command to configure the type of requests that are allowed to be made to the MODBUS TCP server.

Use the **no** variant of this command to revert to the default of read-only.

**Syntax** `scada modbus tcp server access {read-only|read-write}`  
`no scada modbus tcp server access`

**Default** Read-only.

**Mode** Global Configuration

**Example** To allow read and write requests to the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server access read-write
```

To change from read-write access back to the default of read-only, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server access
```

**Related commands**

- Version 5.4.9-0.1: MODBUS support added for x930, x950 series
- Version 5.5.0-1.1: MODBUS support added for IE510 series

# scada modbus tcp server access permit

**Overview** Use this command to limit access to a MODBUS TCP server to specific IP addresses.

When no permitted IP addresses are configured, then any IP address can connect to the MODBUS TCP server.

When permitted IP addresses are configured, only those IP addresses will be allowed to connect to the MODBUS TCP server. All other IP addresses will be rejected.

Use the **no** variant of this command to remove an IP address from the list of permitted addresses.

**Syntax** `scada modbus tcp server access permit <ip-address>`  
`no scada modbus tcp server access permit`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The IPv4 or IPv6 address to permit.

**Default** No IP addresses are configured.

**Mode** Global Configuration

**Example** To allow only 192.168.2.200 to use the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server access permit
192.168.2.200
```

To remove 192.168.2.200 from the permitted MODBUS TCP server client IP addresses, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server access permit
192.168.2.200
```

# scada modbus tcp server connection

**Overview** Use this command to configure the maximum number of concurrent MODBUS TCP clients allowed to be connected to the MODBUS TCP server.

Use the **no** variant of this command to revert to the default of 1.

**Syntax** `scada modbus tcp server connection <1-5>`  
`no scada modbus tcp server connection`

Parameter	Description
<1-5>	The maximum number of concurrent MODBUS TCP clients allowed to be connected to the MODBUS TCP server.

**Default** 1

**Mode** Global Configuration

**Example** To configure the maximum limit of MODBUS TCP clients to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server connection 5
```

To reset the maximum limit of the MODBUS TCP clients back to the default of 1, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server connection
```

**Related commands**

# scada modbus tcp server port

**Overview** Use this command to set the port of the MODBUS TCP server on a device. Clients will use this port to connect to the MODBUS TCP server.

Use the **no** variant of this command to disable MODBUS TCP.

**Syntax** `scada modbus tcp server port <0-65535>`  
`no scada modbus tcp server`

Parameter	Description
<0-65535>	The port number of the MODBUS TCP server

**Default** Port 502

**Mode** Global Configuration

**Example** To configure port number 34567 as the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server port 34567
```

To reset the port number of the MODBUS TCP server to the default of 502, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server port
```
